Evapotranspiration eXperiment

grapex

Lots of ways to measure/estimate ET:

- Soil Water Balance
- Weighing Lysimeters
- Calculated ET- CIMIS
- Measured Directly- Eddy Covariance
- Energy Balance Residual
 - Ground-based & Remotely Sensed
 - Measured vs. Modelled
 - Advection & Closure Issues

California Irrigation Management Information System (CIMIS)

$$ET_c = K_c * ET_o$$

Grapevine evapotranspiration

Crop coefficient

Reference ET
(well-watered
model grass)

Kearney Agricultural Center
Univ. of California- Parlier CA

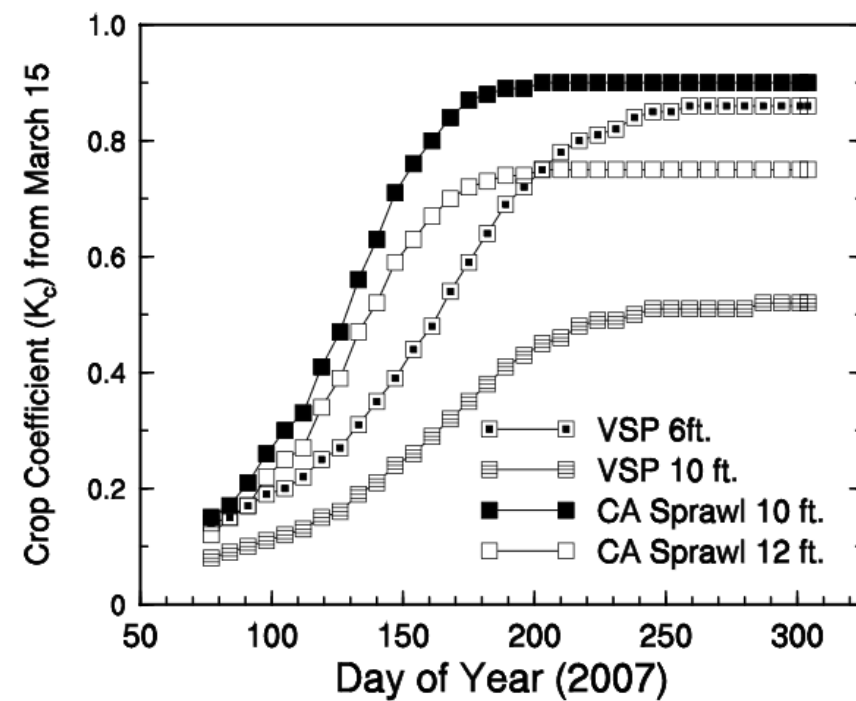

$$K_c = ET_c / ET_o$$

Obtained from vines
in weighing lysimeter

Williams and Ayars (2005)

California Irrigation Management Information System (CIMIS)

$$ET_c = K_c * ET_o * K_s$$

Grapevine evapotranspiration

Crop coefficient

Reference ET
(well-watered
model grass)

Stress
coefficient

$$K_c = ET_c / ET_o$$

Obtained from vines
in weighing lysimeter

Kearney Agricultural Center
Univ. of California- Parlier CA

“...assumes a disease-free plant grown under optimum soil water and nutrient conditions...”

Doorenbos and Pruitt, 1977

Issues:

- CIMIS stations often not well maintained
- Located far from target field
- K_c & K_s -difficult to determine
- Translated from two “potted” vines

Oakville CIMIS Station

10/30/2020

8/30/2023

2/29/2024

Turbulent fluxes measured directly with Eddy Covariance

- “Gold standard” but some uncertainty
- Ideal= large, flat, homogeneous
- Dynamic footprint
 - dependent on wind & stability
- Advection (i.e. additional heat)
 - hot dry grassland next to cool wet crops

Thermal Energy Balance Approaches to Quantify ET

Partitioning the energy at the crop surface

Available Energy

$$\text{Energy Balance Residual} = \overbrace{\text{Net Radiation} - G}^{\text{Available Energy}} - \underbrace{H - LE}_{\text{Turbulent Fluxes}}$$

Correction methods for EBR (i.e. Bowen ratio of H/LE)

Evapotranspiration uncertainty at micrometeorological scales: the impact of the eddy covariance energy imbalance and correction methods

Table 1 Summary description of micrometeorological methodological approaches for daily *ET* estimates

Methodological approach	Abbreviated name	Equation	Description
Eddy covariance <i>ET</i>	ET_{EC}	Equation 2	Sum of eddy covariance <i>ET</i> flux
Eddy covariance daytime <i>ET</i>	ET_{EC-DT}	Equation 3	Sum of daytime eddy covariance <i>ET</i> flux (nighttime fluxes excluded)
Eddy covariance <i>ET</i> corrected by <i>EBR</i> partitioned based on B_o	ET_{B-SD}	Equation 5	Sum of eddy covariance <i>ET</i> fluxes corrected by <i>EBR</i> partitioned based on B_o at each AP
Eddy covariance daytime <i>ET</i> corrected by <i>EBR</i> partitioned based on B_o	$ET_{B-SD-DT}$	Equation 6	Sum of daytime eddy covariance <i>ET</i> fluxes corrected by <i>EBR</i> partitioned based on B_o at each AP
Eddy covariance <i>ET</i> corrected by mean <i>EBR</i> partitioned based on B_o	ET_{B-D}	Equation 7	Sum of eddy covariance <i>ET</i> fluxes corrected by <i>EBR</i> partitioned based on a daily mean B_o
Eddy covariance daytime <i>ET</i> corrected by mean <i>EBR</i> partitioned based on B_o	ET_{B-D-DT}	Equation 8	Sum of daytime eddy covariance <i>ET</i> fluxes corrected by <i>EBR</i> partitioned based on a daily mean B_o
Eddy covariance daytime <i>ET</i> corrected by <i>EBR</i> partitioned based on a moving median B_o	$ET_{B-SD-MM}$	Equation 9	Sum of eddy covariance <i>ET</i> fluxes corrected by <i>EBR</i> partitioned based on a B_o derived as a centered ± 15 days moving median
Energy balance residual <i>ET</i>	ET_{EB}	Equation 10	Sum of energy balance residual <i>ET</i>
Energy balance residual <i>ET</i>	ET_{EB-DT}	Equation 11	Sum of daytime energy balance residual <i>ET</i>

Data for Barelli- near Cloverdale, CA

Thermal Energy Balance Approaches to Quantify ET

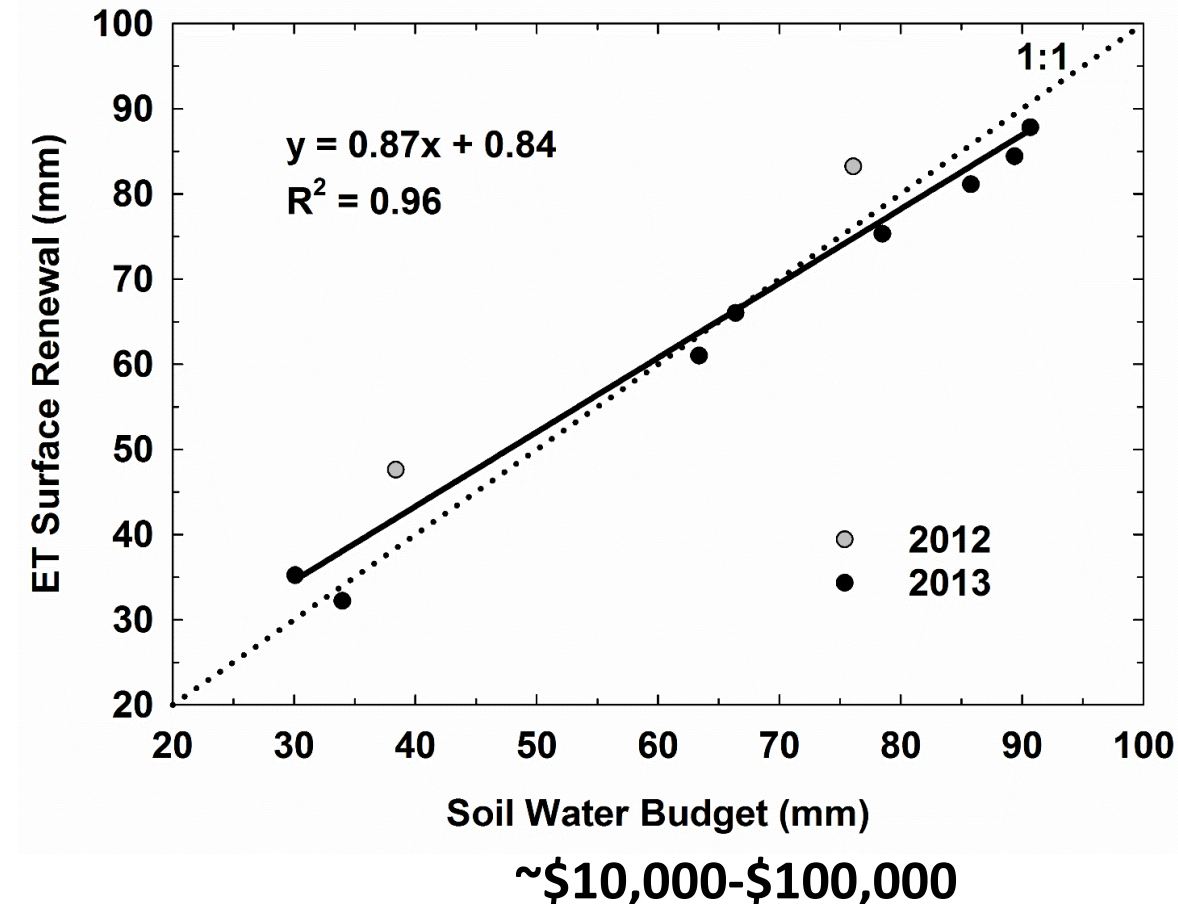

Partitioning the energy at the crop surface

Surface Renewal- Theory vs. Reality

Successfully removed the need to calibrate against expensive research grade system (Shapland et al. 2012a,b, 2014)

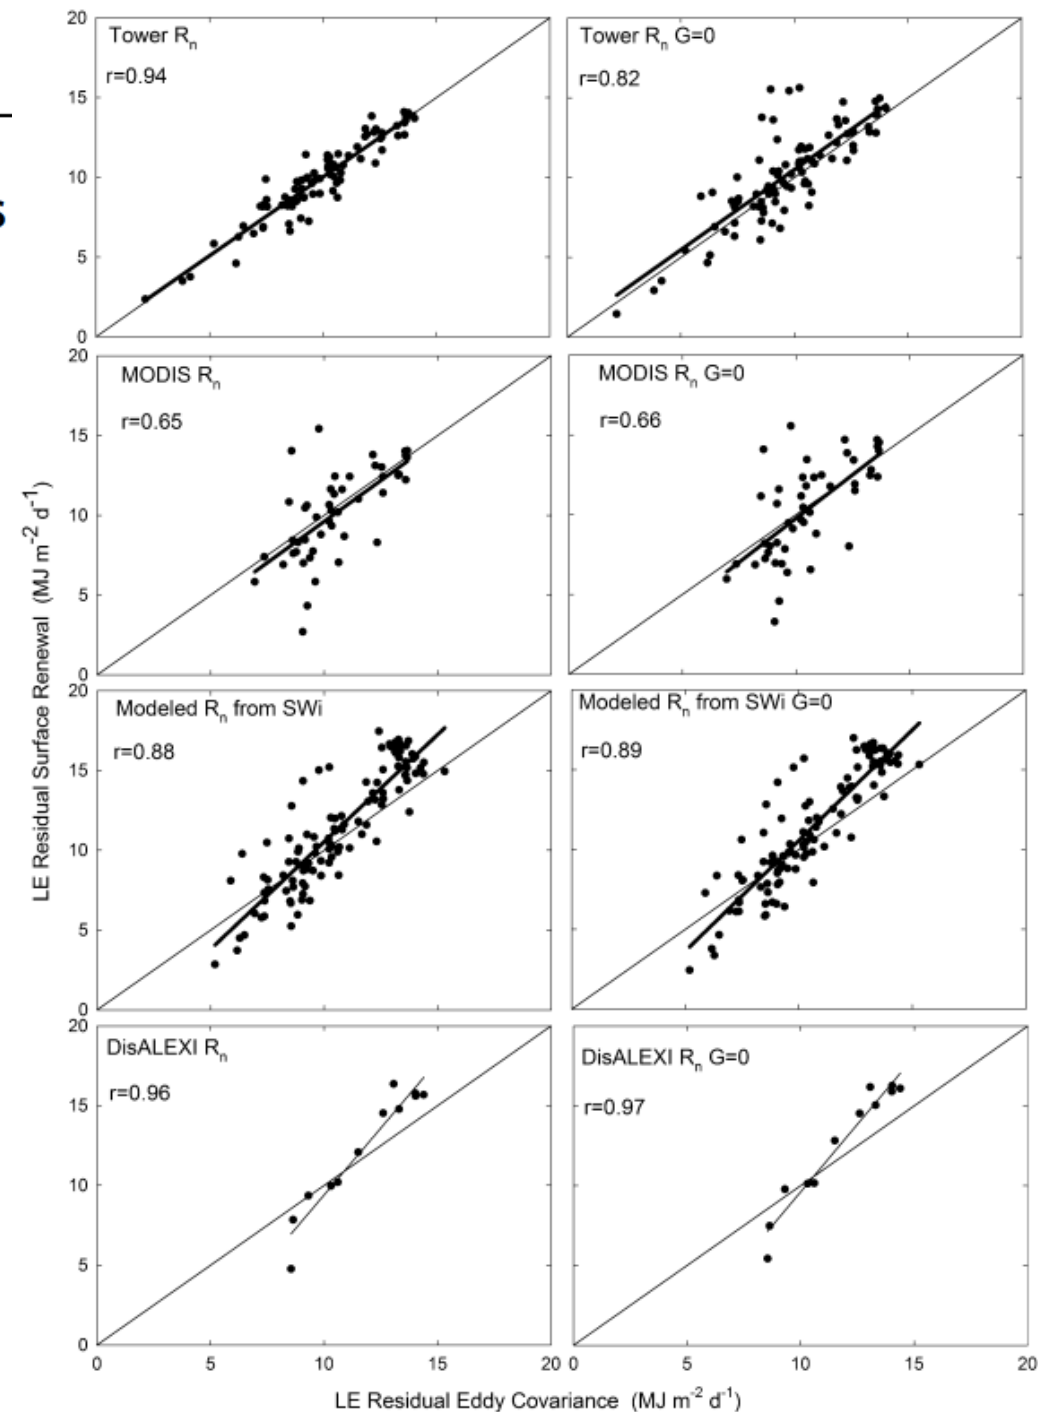

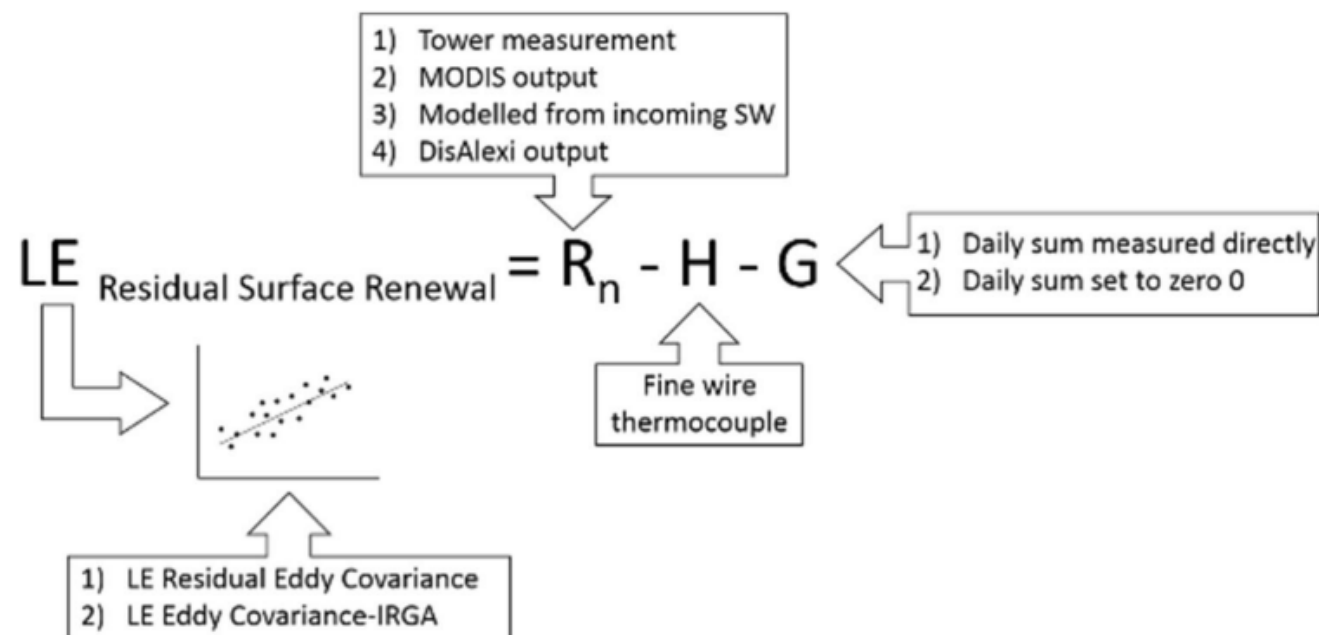

New Surface Renewal System: A reliable & automated ET measurement system

New Commercial System (Tule Technologies)
Joint patent between USDA & UC Davis

Comparison of vineyard evapotranspiration estimates from surface renewal using measured and modelled energy balance components in the GRAPEX project
