1. Vineyard Irrigation Exhibit Reclaimed Process Wastewater-Water Balance for Irrigation and Storage

I. EXECUTIVE SUMMARY

This report is provided to support the Use Permit Determination. Vineyard 29 (APN 022-200-027) proposes to increase production from 48,500 gallons of wine per year to 75,000 gallons and requests recognition and authorization of employees, visitors, and marketing events.

A groundwater recharge rate of 0.3 ac-ft/yr has been adopted for the areas within the Groundwater Sustainability Agency (GSA). This provides an annual allowable water allotment of 7.39 ac-ft/yr for the 24.64-acre parcel. Because the project does not increase water use, Tier 2 and Tier 3 Water Availability Analysis are not required.

The project proposes to drill a public water system replacement well in the vicinity of the existing well, as shown on the Vineyard Irrigation Exhibit in Attachment 1. This is required because the existing well does not have the depth of seal required for a Public Water System. Due to drilling the public water system replacement well in the vicinity of the existing well and the project having no net increase in water use, a Tier 2 and Tier 3 Water Availability Analysis are not required.

II. WATER USE SUMMARY

Beneficial reuse of treated winery process wastewater for vineyard irrigation is proposed so that the program proposed by the winery use permit modification does not increase water use. Irrigation will occur on vineyard blocks on both the winery and adjoining parcel, as shown in attached exhibit.

Usage Type	Existing Usage [af/yr]	Proposed Usage [af/yr]
Vineyard		
Irrigation	2.23	2.23
Irrigation with Treated PWW	0.00	-0.93
Landscaping	0.24	0.24
Winery		
Process Water	1.04	1.61
Domestic Water	0.35	0.49
Totals (Acre-ft per year)	3.86	3.64
Totals per Acre (Acre-ft/acre per year)	0.16	0.15
Estimated Ground Water Recharge (Acre-ft per year)	7.39	7.39
Adopted GSA Groundwater Recharge Rate (Acre-ft/acre per year)	0.30	0.30

The proposed modifications to the Vineyard 29 water use methodology results in a net decrease in water use for the Winery Parcel. The projected water use for the winery parcel decreases from 3.86 to 3.64 acft/yr under this scenario and remains under 0.3 ac-ft/ac.

TECHNICAL CAPACITY

System Description

This report is provided to support the Use Permit Determination. Vineyard 29 (APN 022-200-027) proposes to increase production from 48,500 gallons of wine per year to 75,000 gallons and requests recognition and authorization of employees, visitors, and marketing events.

The winery has an existing Domestic Water Supply Permit via the Calcode system with state ID# 28-00038. With the increase in employees and visitors, the winery will need to establish that the Transient-Noncommunity Water System is served by a code compliant well. This report will demonstrate that a new well with a code compliant seal will be drilled to serve the public water system.

The current well on the property has a 21.5' seal. This well will remain on the property and be used for irrigation purposes. A new well will be drilled with a minimum seal of 50' to provide water for the public water system, and will be used for the public water system, winery process water, and landscape and vineyard irrigation. No chemical or biological treatment will be performed on the well water unless quarterly testing results deem further treatment is necessary. Water for the Public Water System is stored in a $\pm 10,800$ -gallon tank. Separate pumps will supply the domestic water, irrigation water, and fire water.

Twenty-Year Evaluation of Projected Water Demand

Based on the Tier 1 Water Use Calculations, the annual domestic water demand for the winery (employees, visitors, and events) is 0.49 acre-feet per year (160,00 gallons per year).

Source	Number of People/Day	Water Demand [af/yr]
Full-Time Employees	15	0.18
Part-Time Employees	6	0.04
Harvest Employees	5	0.01
Visitors	60	0.18
Marketing Events (10 days/year)	15	0.01
Marketing Events (10 days/year)	25	0.01
Marketing Events (10 days/year)	50	0.02
Marketing Events (5 days/year)	110	0.03
Marketing Events (2 days/year)	165	0.01
Total	•	0.49

The daily average public water demand is 438 gallons per day. Peak daily public water demand is estimated at 876 gallons per day, being 200% of average daily demand.

If the winery seeks expansion in the future, thereby increasing the water demand on the public water system, the facility will need to acquire a use permit modification and prove that increased capacity is available. It will not be permissible for future developments in the vicinity of this project to join this public water system without first justifying that the water supply is available to meet the demand.

Twenty-Year Evaluation of Water Supply Capacity

Additional non-public water demand for both parcels includes winery process water, water for landscaping and vineyard irrigation. This water will be provided from a different well and will not be included in the public water system calculations. The total peak well water demand from the public water system is 876 gallons per day.

The proposed water source will be verified as capable of supporting the proposed peak daily groundwater demand of 876 gal/day when constructed. For comparison the existing well onsite has a capacity of 33 gpm. When pumped on a 50% operational basis (pumping 12 hours per day), the daily project well yield is 23,760 gallons per day. This exceeds the peak daily demand on the well.

33 gpm * 720 min/day = 23,760 gal/day 23,760 $gal/day \ge 876 gallons$ (peak daily total demand)

Source Adequacy

The proposed well will have a minimum seal depth of 50 ft to comply with Napa County Code 13.12.380 as Class IA wells for a Public Water System. The Application and Permit to Construct a Water Well document outlines the well construction and inspection by the Department of Environmental Management. Application and Permit are on file at Napa County.

Water Quality

Water sampling will be conducted prior to operation of the system. Water quality is expected to meet or exceed all requirements of Chapter 15 of Title 22, California Code of Regulations (CCR).

CONSOLIDATION

Vineyard 29 has an existing public water system so no consolidation is required.

MANAGERIAL

General

The owner of the water system will be the property owner of the winery parcel. The costs of operation will be covered in the winery operation costs. The owner will also hold the responsibility of water system manager for the property.

Operation and Maintenance

The following is a summary of the required Operations and Maintenance schedule:

Tasks	Frequency	Action
System Water Level	Daily	Visual Inspection
System Pressure and Conveyance	Daily	Visual Inspection
Water Tanks	Quarterly	Visual Inspection
Manually Operate Valves and Pumps	Quarterly	Operation
Water Quality Test & Reporting	Quarterly	Unit Samples Taken & Reported to Napa Co.

A certified distribution operator or treatment operator (T1 level or above) as specified by Chapter 13 of Title 22 CCR contracted by the owner will be responsible for system repairs.

Monitoring and Testing

Water quality testing will be conducted to comply with Chapter 15 of Title 22 of CCR. Samples will be taken to Caltest or an approved laboratory for testing.

FINANCIAL

Below is a brief summary of the system's annual estimated financial capacity based on winery revenue. Capital improvement costs including well installation and installation of the treatment and distribution systems, are estimated to be a one-time expense of \$70,000, amortized over 20 years.

Capital Improvements: \$3,500

Power: \$2,000

Maintenance: \$3,500

Water Quality Testing: \$5,000

Total: \$14,000

Projected Annual Gross Revenue: \$15,756,500 (Based on 31,513 cases at \$500/case)

Annual Operating Costs: \$3,151,300 (at 20% profit)

Percent of Total Operating Costs: 0.4%
