- E. Napa County Winery Traffic Information/Trip Generation Forms and Site-Specific Peak Hour Calculations
- F. Left-Turn Lane Warrant Graphs
- G. AutoTURN Exhibits

# Executive Summary

---

The proposed project is an update to the current Conditional Use Permit for Duckhorn Vineyards located at 1000 Lodi Lane to allow for an increase in visitation from a maximum of 82 to 219 daily guests and an increase in production from 160,000 to 300,000 gallons annually. As part of the project, a new wine production building would be constructed on the west parcel and the existing hospitality areas on the east parcel would be expanded.

The change in operation resulting from the proposed CUP modification would be expected to result in a net increase of 120 daily trips on a Friday during harvest, including 17 new trips during the p.m. peak hour, and a net increase of 112 new trips on a Saturday during harvest, with 17 new trips during the peak hour. Adjusting the number of net new trips anticipated on Friday to a typical weekday average, and accounting for a two-month harvest season, the project would be expected to result in an average of approximately 79 new daily trips per weekday over the course of the year.

Analysis indicates that the study roadway segments of SR 29, Lodi Lane, and Silverado Trail and the study intersection of Silverado Trail/Lodi Lane are projected to operate acceptably at LOS D or better under Existing, Near-Term, and Cumulative Conditions, and would continue to do so with the addition of project-generated traffic. The study intersection of SR 29/Lodi Lane would operate unacceptably at LOS E or F under Existing and Near-Term Conditions, though the project would result in less than five seconds of additional delay, so the effect is considered acceptable. However, under Cumulative Conditions, the stop-controlled approach at SR 29/Lodi Lane would operate at LOS F and the project would result in an adverse effect since project trips represent more than 10 percent of the anticipated growth during each peak hour. To offset the project's effect under Cumulative volumes, it is recommended that the westbound approach at SR 29/Lodi Lane be restriped to include a dedicated right-turn lane. The cost for this improvement could be shared with the Inn at the Abbey since it was also recommended for that project.

As of the date of this analysis, the County of Napa has not yet established thresholds of significance related to Vehicle Miles Traveled (VMT) so the project was assessed based on guidance provided by the California Governor's Office of Planning and Research (OPR) in the publication *Transportation Impacts (SB 743) CEQA Guidelines Update and Technical Advisory*. Under this guidance, the project can be presumed to have a less-than-significant impact on VMT since it would result in fewer than 110 new daily trips per typical weekday.

Existing pedestrian and transit facilities serving the site are limited, though given the rural location of the site and anticipated demand for these modes, this is considered an acceptable condition. The existing Class II bike lanes on Silverado Trail along with the shared use of Lodi Lane with motorists and planned facilities consisting of the Vine Trail and a Class III bike route on SR 29 would provide adequate access for bicyclists. The proposed vehicular parking supply is adequate to accommodate the anticipated peak parking demand, though it is recommended that secure parking facilities for ten bicycles be provided on-site.

Access to the Estate House and hospitality areas would continue to occur via the existing driveway on Lodi Lane approximately 200 feet west of Silverado Trail. The new West Winery would be accessed from an existing driveway on Lodi Lane approximate halfway between SR 29 and Silverado Trail. Sight distances were field measured at each driveway location and determined to be adequate for the posted speed limit.

A left-turn lane is warranted at the east driveway under existing volumes based on application of the County's criterion but, even with project trips added, would not be warranted at the west driveway. Although a left-turn lane is warranted at the east driveway, a review of the roadside conditions indicates that numerous trees would need to be removed to accommodate the turn lane, which conflicts with the County's policies to retain heritage trees; conditions to request an exception are therefore satisfied. The driveway to the West Winery should be improved to meet the County's design standards for rural commercial driveways.

Given that study intersection of Silverado Trail/Lodi Lane as well as the study segments of Silverado Trail both north and south of the intersection have calculated collision rates above the statewide average for similar facilities, it is recommended that whichever project is approved first between the Inn at the Abbey or Duckhorn Vineyards work with the County to install a northbound speed feedback sign on Silverado Trail near the Melka Estates Winery driveway. Additionally, the applicant should work with the County to install a speed feedback sign in the southbound direction near Glass Mountain Road.

# Introduction

---

This report presents an analysis of the potential transportation impacts that would be associated with the proposed modification to the Conditional Use Permit (CUP) for Duckhorn Vineyards located at 1000 Lodi Lane in the County of Napa. The traffic study was completed in accordance with the criteria established by the County of Napa, reflects a scope of work requested by County staff, and is consistent with standard traffic engineering techniques.

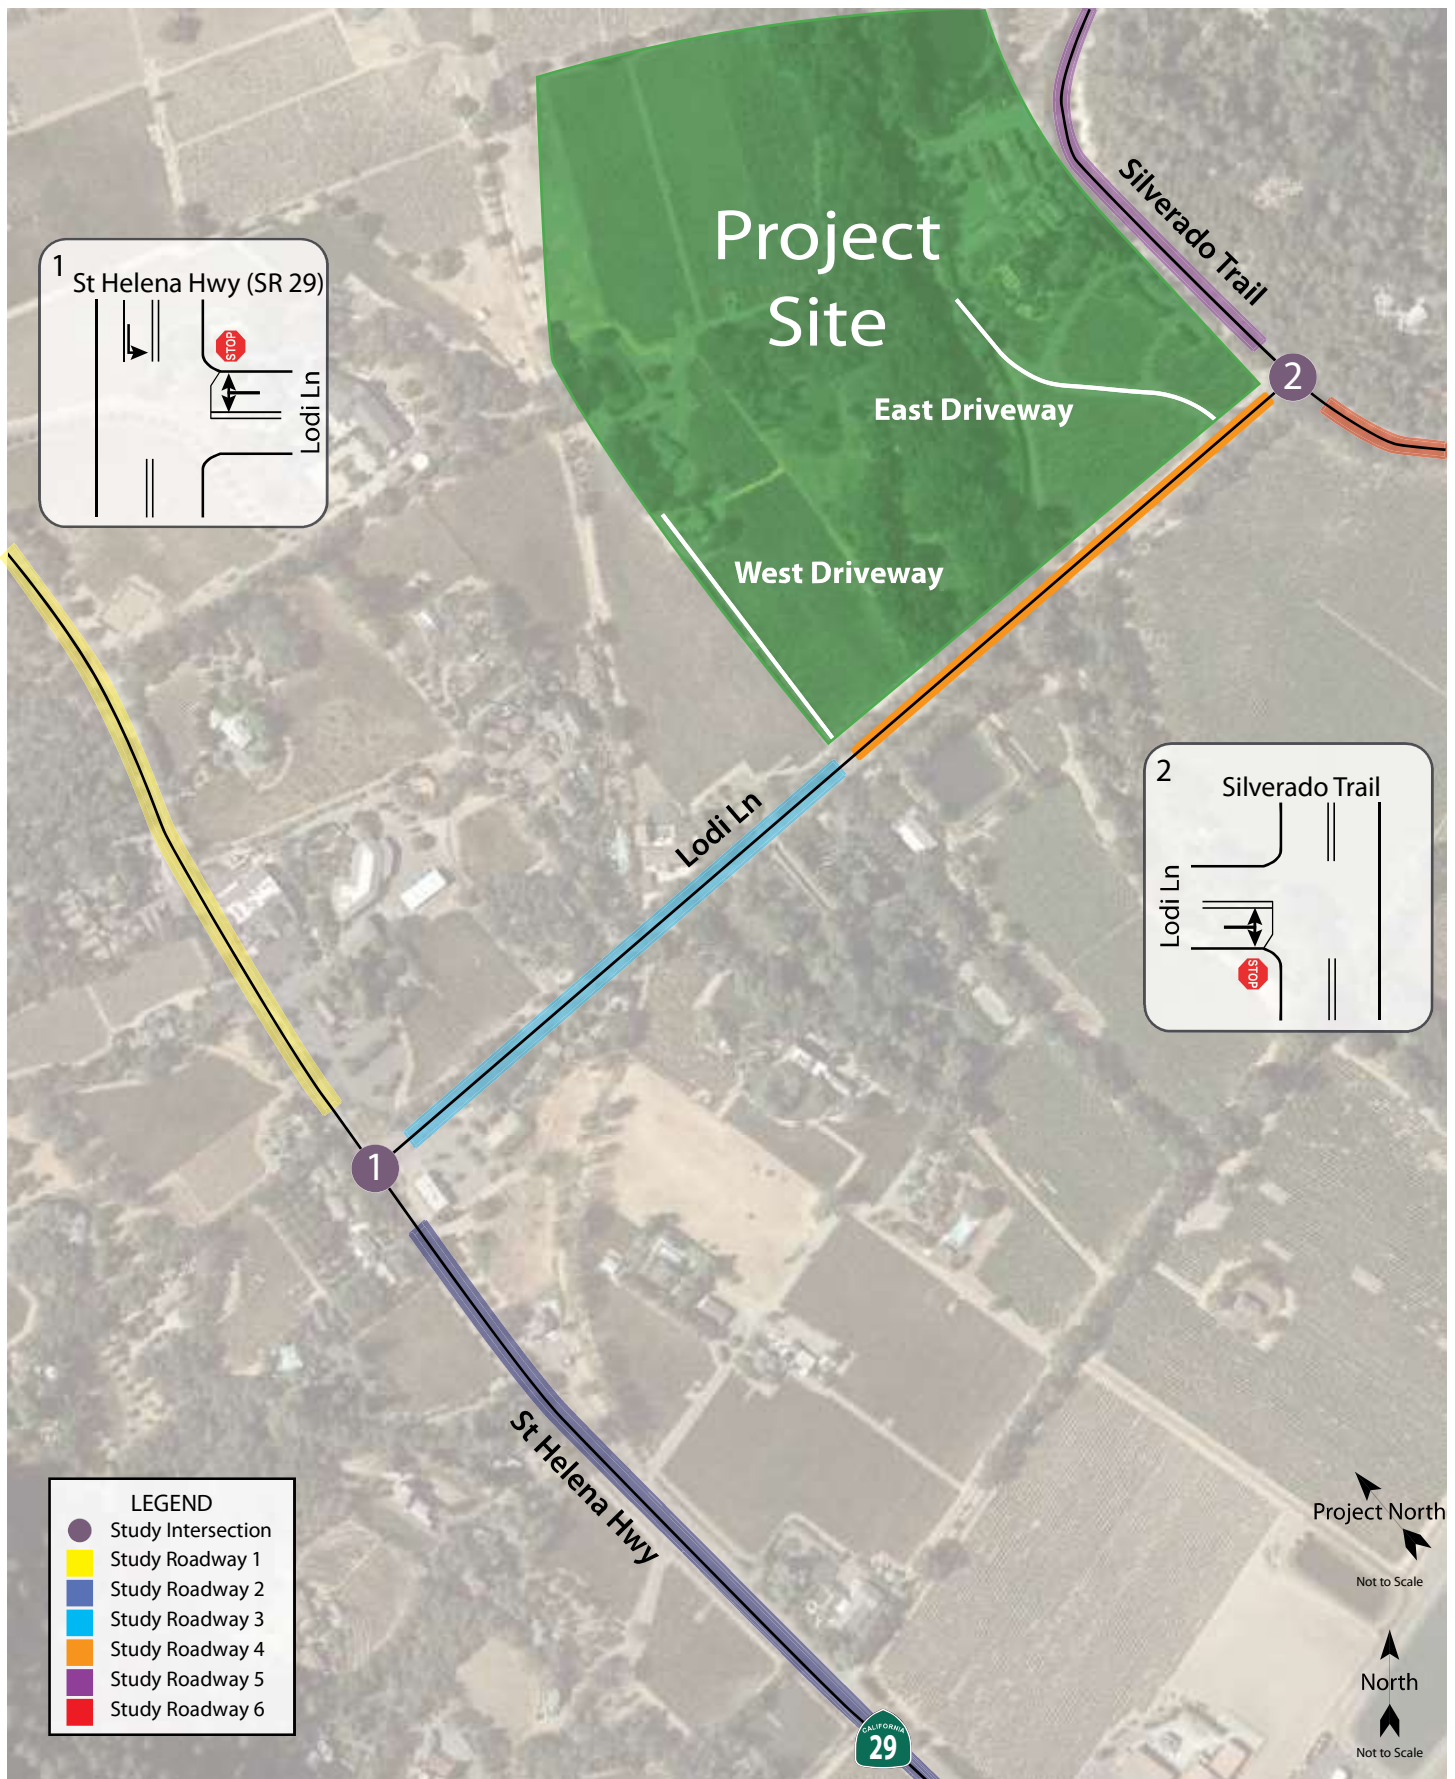

## Prelude

The purpose of a traffic impact study is to provide County staff and policy makers with data that they can use to make an informed decision regarding the potential transportation impacts of a proposed project, and any associated improvements that would be required in order to mitigate these impacts to an acceptable level under the California Environmental Quality Act (CEQA), the County's General Plan, or other policies. Impacts relative to access for pedestrians, bicyclists, and to transit are addressed in the context of the CEQA criteria. Consistent with Senate Bill (SB) 743, the project's transportation impacts were analyzed using Vehicle Miles Traveled (VMT). While no longer a part of the CEQA review process, vehicular traffic service levels at key intersections and on affected roadway segments were evaluated for consistency with General Plan policies by determining the number of new trips that the proposed project would be expected to generate, distributing these trips to the surrounding street system based on anticipated travel patterns specific to the proposed project, then analyzing the effect the new traffic would be expected to have on the study intersections and roadway segments.

## Project Profile

The proposed project would include construction of a new wine production building on the recently acquired adjacent parcel, expansion of the existing Estate House, and development of additional outdoor hospitality areas. As part of the project, the current Use Permit would be updated to allow for an increase in maximum daily visitation from 82 to 219 guests and an increase in production from 160,000 to 300,000 gallons annually. The largest marketing event would be decreased from 600 to 400 guests. No changes are proposed to staffing levels. The County of Napa file number for this project is P19-00097.

The project site is located on the north side of Lodi Lane, as shown in Figure 1.

**Traffic Impact Study for the Duckhorn Vineyards Use Permit Modification**  
**Figure 1 – Study Area and Existing Lane Configurations**

# Transportation Setting

---

## Operational Analysis

### Study Area and Periods

The study area consists of the following intersections and roadway segments. Operating conditions during the Friday and Saturday afternoon peak periods were evaluated as these time periods reflect the highest trip generation potential for the proposed project based on a review of count data collected at the driveway of the existing winery and tasting room. In the study area, the Friday afternoon peak hour generally occurred between 2:30 p.m. and 3:30 p.m., while the Saturday afternoon peak hour generally occurred between 2:00 p.m. and 3:00 p.m. Consistent with the County's *Administrative Draft Traffic Impact Study Guidelines*, dated August 3, 2020, six analysis scenarios were evaluated as is typical for winery analyses, including Existing, Existing plus Project, Baseline (Existing plus Approved), Baseline plus Project, Future, and Future plus Project Conditions.

### Study Intersections

1. St. Helena Highway (SR 29)/Lodi Lane
2. Silverado Trail/Lodi Lane

### Study Roadways

1. SR 29 – North of Lodi Lane
2. SR 29 – South of Lodi Lane
3. Lodi Lane – West of Project Driveway
4. Lodi Lane – East of Project Driveway
5. Silverado Trail – North of Lodi Lane
6. Silverado Trail – South of Lodi Lane

### Study Intersections

For the purposes of this study, SR 29 and Silverado Trail were considered to run north-south and Lodi Lane was considered to run east-west.

**SR 29/Lodi Lane** is an unsignalized tee-intersection stop-controlled on the westbound Lodi Lane approach. A left-turn lane is provided on the southbound SR 29 approach and the Lodi Lane approach has a flared right-turn area with storage space to accommodate approximately two vehicles.

**Silverado Trail/Lodi Lane** is an unsignalized tee-intersection stop-controlled on the eastbound Lodi Lane approach. The eastbound approach has a flared right-turn area with storage space to accommodate approximately one vehicle.

The locations of the study intersections and the existing lane configurations and controls are shown in Figure 1.

## Study Roadways

**SR 29** runs northwest-southeast in the project vicinity and has two 12-foot travel lanes with a posted speed limit of 50 miles per hour (mph). The roadway is mostly straight near Lodi Lane; however, there is a grade of approximately four percent in the northbound direction. The roadway varies in width between approximately 36 and 46 feet depending on the width of the shoulders and the presence of a left-turn lane. Based on count data collected during harvest in August 2017, the average daily traffic (ADT) near Lodi Lane is approximately 15,000 on weekdays and 14,000 on weekend days.

**Lodi Lane** is a rural two-lane roadway that runs southwest-northeast between SR 29 and Silverado Trail. The roadway varies in width between approximately 24 and 30 feet, has a marked centerline and a posted speed limit of 40 mph, except for the bridge over the Napa River which has a width of 16 feet and functions as a one-lane bridge. Based on traffic counts collected specifically for this study in October 2019, the roadway has an ADT of approximately 1,470 on weekdays and 1,000 on weekend days to the west of the Duckhorn Vineyards driveway.

**Silverado Trail** is a two-lane roadway that winds its way mostly parallel to SR 29 throughout the Napa Valley. The segment between Bournemouth Road and Glass Mountain Road has a 12-foot travel lane and five-foot bike lane in each direction, is approximately 34 feet wide, and has a posted speed limit of 50 mph, though the horizontal curves to the south of Lodi Lane have a posted advisory speed of 40 mph and the curve to the north has a posted advisory speed of 35 mph.

## Collision History

The collision history for the study area was reviewed to determine any trends or patterns that may indicate a safety issue. Collision rates for the study intersections and roadway segments were calculated based on records available from the California Highway Patrol (CHP) as published in their Statewide Integrated Traffic Records System (SWITRS) reports. The most current five-year period available at the time of the analysis is October 1, 2014 through September 30, 2019.

As presented in Table 1, the calculated collision rates for the study intersections were compared to average collision rates for similar facilities statewide, as indicated in *2016 Collision Data on California State Highways*, California Department of Transportation (Caltrans). The intersection of SR 29/Lodi Lane had a collision rate below the statewide average indicating that the intersection is operating acceptably with regards to safety; however, the intersection of Silverado Trail/Lodi Lane had a collision rate slightly higher than the statewide average despite having only three incidents in five years, which warranted further analysis. The collision rate calculations for the study intersections and segments are provided in Appendix A.

**Table 1 – Collision Rates at the Study Intersections**

Study Intersection	Number of Collisions (2014-2019)	Calculated Collision Rate (c/mve)	Statewide Average Collision Rate (c/mve)
1. SR 29/Lodi Ln	3	0.11	0.16
2. Silverado Trail/Lodi Ln	3	<b>0.22</b>	0.16

Note: c/mve = collisions per million vehicles entering; **bold** text denotes collision rate exceeds statewide average

Further review of the individual collisions that occurred at Silverado Trail/Lodi Lane revealed that all three of the collisions involved a motorist travelling northbound on Silverado Trail. Two of the collisions involved a following motorist traveling at an unsafe speed and rear-ending a preceding motorist slowing to turn left onto Lodi Lane. The other collision was a broadside due to travelling on the wrong side of the road. The same collision pattern was noted in the *Traffic Impact Study for the Inn at the Abbey*, W-Trans, 2019, which included the following language.

*“Physical improvements such as installation of a left-turn lane are not feasible due to lack of right-of-way and geographic constraints, including drainage facilities on one side and a hill on the other. Consideration was given to installation of all-way stop-controls but doing so would result in LOS F operation so is not recommended. The two horizontal curves to the south of the intersection have a posted advisory speed of 40 mph and there is approximately 300 feet of stopping sight distance available in the northbound direction while traversing the curves, which is the exact amount recommended by Caltrans for speeds of 40 mph, so adequate stopping sight distance is provided for vehicles traveling at the advisory speed. However, if motorists travel at speeds above the posted advisory speed, sight distance is less than the recommended minimum. Installation of a speed feedback sign near the curves would make motorists more aware of their speed and encourage them to travel at a more appropriate speed for the amount of stopping sight distance available. It is recommended that the applicant work with County staff to install a speed feedback sign on Silverado Trail in the northbound direction between the driveway to Melka Estates Winery and the horizontal curve. Additionally, increased enforcement may reduce unsafe speeds on Silverado Trail and consequently the frequency of rear-end collisions.”*

It is recommended that whichever project is approved first between the Inn at the Abbey and Duckhorn Vineyards work with the County to install a speed feedback sign at the location identified above.

Collision rates for the study roadway segments are compared to statewide averages for similar facilities in Table 2. It is noted that Ehlers Lane was used as the northern boundary for SR 29 while Glass Mountain Road was used as the northern boundary for Silverado Trail and Deer Park Road was used as the southern boundary for both SR 29 and Silverado Trail. SR 29 experienced collisions at below-average rates and Silverado Trail had calculated collision rates higher than the statewide average; there were no collisions reported on Lodi Lane during the evaluation period.

**Table 2 – Collision Rates for the Study Roadway Segments**

Study Roadway Segment	Number of Collisions (2014-2019)	Calculated Collision Rate (c/mvm)	Statewide Average Collision Rate (c/mvm)
1. SR 29 – North of Lodi Ln	9	0.61	1.10
2. SR 29 – South of Lodi Ln	15	0.97	1.10
3. Lodi Ln – West of Project Dwy	0	0.00	0.98
4. Lodi Ln – East of Project Dwy	0	0.00	0.98
5. Silverado Trail – North of Lodi Ln	10	<b>1.69</b>	1.12
6. Silverado Trail – South of Lodi Ln	10	<b>1.64</b>	1.12

Note: c/mvm = collisions per million vehicles miles; **bold** text denotes collision rate exceeds statewide average

A total of 10 collisions were reported on each segment of Silverado Trail, to both the north and south of Lodi Lane. Considering both segments, 11 of the 20 collisions involved a motorist travelling southbound and nine involved a motorist travelling northbound, resulting in no particular trend in terms of directionality. Approximately 70 percent of the collisions were attributed to unsafe speed or improper turning, which is consistent with the collisions that occurred at the intersection of Silverado Trail/Lodi Lane, and is likely due to the fact that the 1.1-mile roadway segment between Glass Mountain Road and Deer Park Road has five horizontal curves. Installation of a speed feedback sign near the Melka Estates Winery driveway would not just help to reduce collisions at the Lodi Lane intersection, but along the segment in general in the northbound direction. To address collisions in the southbound direction, it is recommended that the applicant work with the County to install a speed feedback sign facing southbound traffic near the 45-mph speed limit sign posted south of Glass Mountain Road.

## Alternative Modes

### Pedestrian Facilities

Pedestrian facilities include sidewalks, crosswalks, pedestrian signal phases, curb ramps, curb extensions, and various streetscape amenities such as lighting, benches, etc. As might be expected given the rural location of Duckhorn Winery, a connected pedestrian network is lacking, though such facilities would not be appropriate in this setting.

### Bicycle Facilities

The *Highway Design Manual*, Caltrans, 2017, classifies bikeways into four categories:

- **Class I Multi-Use Path** – a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross flows of motorized traffic minimized.
- **Class II Bike Lane** – a striped and signed lane for one-way bike travel on a street or highway.
- **Class III Bike Route** – signing only for shared use with motor vehicles within the same travel lane on a street or highway.
- **Class IV Bikeway** – also known as a separated bikeway, a Class IV Bikeway is for the exclusive use of bicycles and includes a separation between the bikeway and the motor vehicle traffic lane. The separation may include, but is not limited to, grade separation, flexible posts, inflexible physical barriers, or on-street parking.

There are existing Class II bike lanes on Silverado Trail in the project study area and there are plans to provide a Class III bike route on SR 29 and a Class I regional trail (the Vine Trail) parallel to SR 29 that would ultimately connect Vallejo to Calistoga. A 12.5-mile segment of the Vine Trail has already been constructed between south Napa and Yountville; the Napa Valley Vine Trail Coalition (NVVTC) has stated that they are hoping to complete the rest of the trail network by 2022. Table 3 summarizes the existing and planned bicycle facilities in the project vicinity, as contained in the *Napa Countywide Bicycle Plan*, Napa Valley Transportation Authority (NVTa), 2019.

**Table 3 – Existing and Planned Bicycle Facilities in the Project Vicinity**

<b>Status Facility</b>	<b>Class</b>	<b>Length (miles)</b>	<b>Begin Point</b>	<b>End Point</b>
<b>Existing</b> Silverado Trail	II	2.9	Bale Ln	Deer Park Rd
<b>Planned</b> Vine Trail	I	3.1	Lodi Ln	Deer Park Rd
SR 29	III	6.2	Calistoga City Limit	Deer Park Rd

Source: *Napa Countywide Bicycle Plan*, Napa Valley Transportation Authority, 2019

## Transit Facilities

Transit services throughout Napa County are provided by Napa Valley Transit (VINE). There are no transit routes that stop within one-quarter mile, which is considered a comfortable walking distance, of the project site. The closest transit access is approximately 0.7 miles from the Duckhorn property on SR 29 at Lodi Lane. VINE Route 10 provides service between Napa Valley College and Calistoga seven days a week and stops on SR 29 to the north of Lodi Lane in both directions. Both stops are equipped with benches and the southbound stop has an overhead shelter. While these bus stops are not within acceptable walking distance of the project site, employees could reasonably bike between the project site and the bus stops.

All vehicles used by VINE are wheelchair accessible and conform to standards set forth by the Americans with Disabilities Act (ADA). However, dial-a-ride, also known as paratransit or door-to-door service, is available for those who are unable to independently use the transit system due to a physical or mental disability. VINE Go is VINE's paratransit service and is designed to serve the needs of individuals with disabilities in the cities of Calistoga, St. Helena, Napa, American Canyon, the Town of Yountville, and the unincorporated areas of Napa County. Reservations are required and, while can be made the same day of the trip, are recommended to be made in advance.

# Capacity Analysis

## Intersection Level of Service Methodologies

Level of Service (LOS) is used to rank traffic operation on various types of facilities based on traffic volumes and roadway capacity using a series of letter designations ranging from A to F. Generally, Level of Service A represents free flow conditions and Level of Service F represents forced flow or breakdown conditions. A unit of measure that indicates a level of delay generally accompanies the LOS designation.

The study intersections were analyzed using the “Two-Way Stop-Controlled” methodology published in the *Highway Capacity Manual*, 6<sup>th</sup> Edition, Transportation Research Board, 2018. This source contains methodologies for various types of intersection control, all of which are related to a measurement of delay in average number of seconds per vehicle. The “Two-Way Stop-Controlled” intersection capacity methodology determines a level of service for each minor turning movement by estimating the level of average delay in seconds per vehicle. Results are presented for individual movements together with the weighted overall average delay for the intersection.

The ranges of delay associated with the various levels of service are indicated in Table 4.

**Table 4 – Two-Way Stop-Controlled Intersection Level of Service Criteria**

LOS A	Delay of 0 to 10 seconds. Gaps in traffic are readily available for drivers exiting the minor street.
LOS B	Delay of 10 to 15 seconds. Gaps in traffic are somewhat less readily available than with LOS A, but no queuing occurs on the minor street.
LOS C	Delay of 15 to 25 seconds. Acceptable gaps in traffic are less frequent, and drivers may approach while another vehicle is already waiting to exit the side street.
LOS D	Delay of 25 to 35 seconds. There are fewer acceptable gaps in traffic, and drivers may enter a queue of one or two vehicles on the side street.
LOS E	Delay of 35 to 50 seconds. Few acceptable gaps in traffic are available, and longer queues may form on the side street.
LOS F	Delay of more than 50 seconds. Drivers may wait for long periods before there is an acceptable gap in traffic for exiting the side streets, creating long queues.

Reference: *Highway Capacity Manual*, 6<sup>th</sup> Edition, Transportation Research Board, 2018

## Two-Lane Highway Segment Level of Service Methodology

The roadway segment Level of Service methodology found in Chapter 15, "Two-Lane Highways," of the *Highway Capacity Manual* is the basis of the automobile LOS analysis. The methodology considers traffic volumes, terrain, roadway cross-section, the proportion of heavy vehicles, and the availability of passing zones. The LOS criteria for two-lane highways differs depending on whether the highway is considered “Class I,” “Class II,” or “Class III.” Class I highways are typically long-distance routes connecting major traffic generators or national highway networks where motorists expect to travel at high speeds. Motorists do not necessarily expect to travel at high speeds on Class II highways, which often function as scenic or recreational routes and typically serve shorter trips. Class III highways may be

portions of Class I or Class II highways that pass through towns and communities and have a mix of local traffic and through traffic.

The measure of effectiveness by which Level of Service is determined on Class I highways is average travel speed (ATS) and percent time spent following (PTSF), or the proportion of time that drivers on the highway are limited in their speed by a driver in front of them. Class II highways are also assessed in terms of PTSF. Class III highways are measured by percent of free-flow speed (PFFS), which represents the ability of vehicles to travel at or near the posted speed limit. SR 29, Silverado Trail, and Lodi Lane were all defined as a Class II highway for the purposes of this analysis. A summary of the PTSF breakpoints for Class II highways are shown in Table 5.

Table 5 – Automobile Level of Service Criteria	
LOS	Class II Highways PTSF (%)
A	≤40
B	>40-55
C	>55-70
D	>70-85
E	>85

Notes: LOS = Level of Service; PTSF = Percent Time Spent Following

Reference: *Highway Capacity Manual*, 6<sup>th</sup> Edition, Transportation Research Board, 2018

## Traffic Operation Standards

### Napa County

In the Circulation Element of the *Napa County General Plan*, the following policies have been adopted:

- **Policy CIR-31** – The County seeks to provide a roadway system that maintains current roadway capacities in most locations and is efficient in providing local access.
- **Policy CIR-38** – The County seeks to maintain operations of roads and intersections in the unincorporated County area that minimize travel delays and promote safe access for all users. Operational analysis shall be conducted according to the latest version of the *Highway Capacity Manual* and as described in the current version of the County's Transportation Impact Study Guidelines. In general, the County seeks to maintain Level of Service (LOS) D on arterial roadways and at signalized intersections, as the service level that best aligns with the County's desire to balance its rural character with the needs of supporting economic vitality and growth.

*In situations where the County determines that achieving LOS D would cause an unacceptable conflict with other goals and objectives, minimizing collisions and the adequacy of local access will be the County's priorities. Mitigating operational impacts should first focus on reducing the project's vehicular trips through modifying the project definition, applying TDM strategies, and/or applying new technologies that could reduce vehicular travel and associated delays; then secondarily should consider physical infrastructure changes. Proposed mitigations will be evaluated for their effect on*

collisions and local access, and for their effectiveness in achieving the maximum potential reduction in the project's operational impacts (see the County's Transportation Impact Study Guidelines for a list of potential mitigation measures).

The following roadway segments are exceptions to the LOS D standard described above:

- State Route 29 in the unincorporated areas between Yountville and Calistoga: LOS F is acceptable.
- Silverado Trail between State Route 128 and Yountville Cross Road: LOS E is acceptable.
- State Route 12/121 between the Napa/Sonoma county line and Carneros Junction: LOS F is acceptable.
- American Canyon Road from I-80 to American Canyon City Limit: LOS E is acceptable.

To provide a more quantitative method of adhering to the above standards, the County refers to a memorandum titled *Guidelines for Application of Updated General Plan Circulation Policies on Significance Criteria Related to Vehicle Level of Service* (Fehr & Peers, 2020). The document establishes thresholds for road segments and different intersection control types. The memorandum states a project would cause an adverse effect requiring mitigation if, for Existing Conditions:

- An arterial segment operates at LOS A, B, C or D during the selected peak hours without Project trips, and deteriorates to LOS E or F with the addition of Project trips; or
- An arterial segment operates at LOS E or F during the selected peak hours without Project trips, and the addition of Project trips increases the total segment volume by **one percent** or more. The following equation should be used if the arterial segment operates at LOS E or F without the Project:
  - $\text{Project Contribution \%} = \text{Project Trips} \div \text{Existing Volumes}$
- A signalized intersection operates at LOS A, B, C, or D during the selected peak hours without Project trips, and the LOS deteriorates to LOS E or F with the addition of Project trips; or
- A signalized intersection operates at LOS E or F during the selected peak hours without Project trips, and the addition of Project trips increases the total entering volume by **one percent** or more. The following equation should be applied:
  - $\text{Project Contribution \%} = \text{Project Trips} \div \text{Existing Volumes}$
- An unsignalized intersection operates at LOS A, B, C, or D during the selected peak hours without Project trips, and the LOS deteriorates to LOS E or F with the addition of Project traffic; the peak hour traffic signal warrant criteria should also be evaluated and presented for informational purposes; or
- An unsignalized intersection operates at LOS E or F during the selected peak hours without Project trips, and the Project increases the delay by **five seconds** or more; the peak hour traffic signal warrant criteria should also be evaluated and presented for informational purposes.
  - All-Way Stop-Controlled Intersections – The increase in delay should be calculated based on the overall average delay for the intersection.

- *Side-Street Stop-Controlled Intersections* – The increase in delay should be calculated based on the delay for the worst-case approach(es). Each stop-controlled approach that operates at LOS E or F should be analyzed individually.

A project would cause an adverse effect requiring mitigation if, for Future (Cumulative) Conditions, the Project's volume is equal to, or greater than **one percent** of the difference between Future and Existing volumes for an arterial, signalized intersection, or all-way stop-controlled intersection and **10 percent** for the impacted approach at two-way stop-controlled intersections.

- Cumulative Conditions – A Project's contribution to a cumulative condition would be calculated as the Project's percentage contribution to the total growth in traffic. This calculation applies to arterials, signalized intersections, and unsignalized intersections.
  - $Project\ Contribution\ \% = Project\ Trips \div (Cumulative\ Volumes - Existing\ Volumes)$

**Significance threshold for failing intersections:** General Plan policy accepts LOS E and F in certain instances. If an unsignalized intersection is operating acceptably (LOS A through LOS D), and the project would cause the intersection to fall to LOS E or LOS F, the applicant must mitigate the impact to restore to LOS D at minimum, or the project is considered to adversely affect operation of the intersection. If an intersection is already LOS E or LOS F, and the project would increase delay by five or more seconds, the applicant must mitigate the impact to lower the increase in delay, or else the project would be considered to adversely affect the intersection. The same standards apply to the analysis of minor approaches to unsignalized intersections. As CEQA Guidelines have shifted away from LOS and toward VMT as the determining factor in identifying significant transportation impacts, adverse effects to intersections may still be the basis for conditioning transportation improvements to improve or maintain existing LOS or denying a project for the project's potentially negative effects on public safety.

## Existing Conditions

The Existing Conditions scenario provides an evaluation of current operation based on existing traffic volumes during the afternoon p.m. peak hour on both Fridays and Saturdays. Volume data collected at the winery driveway during harvest in October 2019 indicates that the site generates the highest percentage of trips in the afternoon period on both Fridays and Saturdays so intersection turning movement volumes were collected at both study intersections between 2:00 and 5:00 p.m. on Fridays and between 2:00 and 4:00 p.m. on Saturdays. All count data was collected during typical harvest operations and clear weather conditions. Consistent with the TIS Guidelines, intersection turning movement counts were collected on two separate Fridays and Saturdays and the higher of the two counts was retained for the analysis. Peak hour segment volumes for each of the six study roadway segments were derived from the intersection counts.

Peak hour factors (PHFs) were calculated based on the counts obtained and used in the level of service calculations. Additionally, the percentage of heavy vehicles at each intersection was calculated based on previous data collected during harvest in September 2017. For the purpose of this study, heavy vehicles were considered to be trucks hauling grapes or those with five or more axles. The data indicates that heavy vehicles represent four percent of all vehicles through the intersection of SR 29/Lodi Lane during the Friday p.m. peak hour and two percent during the Saturday p.m. peak hour. At Silverado Trail/Lodi Lane, heavy vehicles represent two and three percent of vehicles during the Friday p.m. and Saturday p.m.

peak hours, respectively. The PHFs are included in the traffic counts in Appendix B along with the heavy vehicle volume data.

## Intersection Levels of Service

The stop-controlled minor street approaches are operating acceptably under Existing Conditions at both study intersections during both peak periods evaluated, except for SR 29/Lodi Lane during the Friday p.m. peak hour. The Existing traffic volumes are shown in Figure 2. A summary of the intersection level of service calculations is contained in Table 6, and copies of the intersection Level of Service calculations for all evaluated scenarios are provided in Appendix C.

**Table 6 – Existing Peak Hour Intersection Levels of Service**

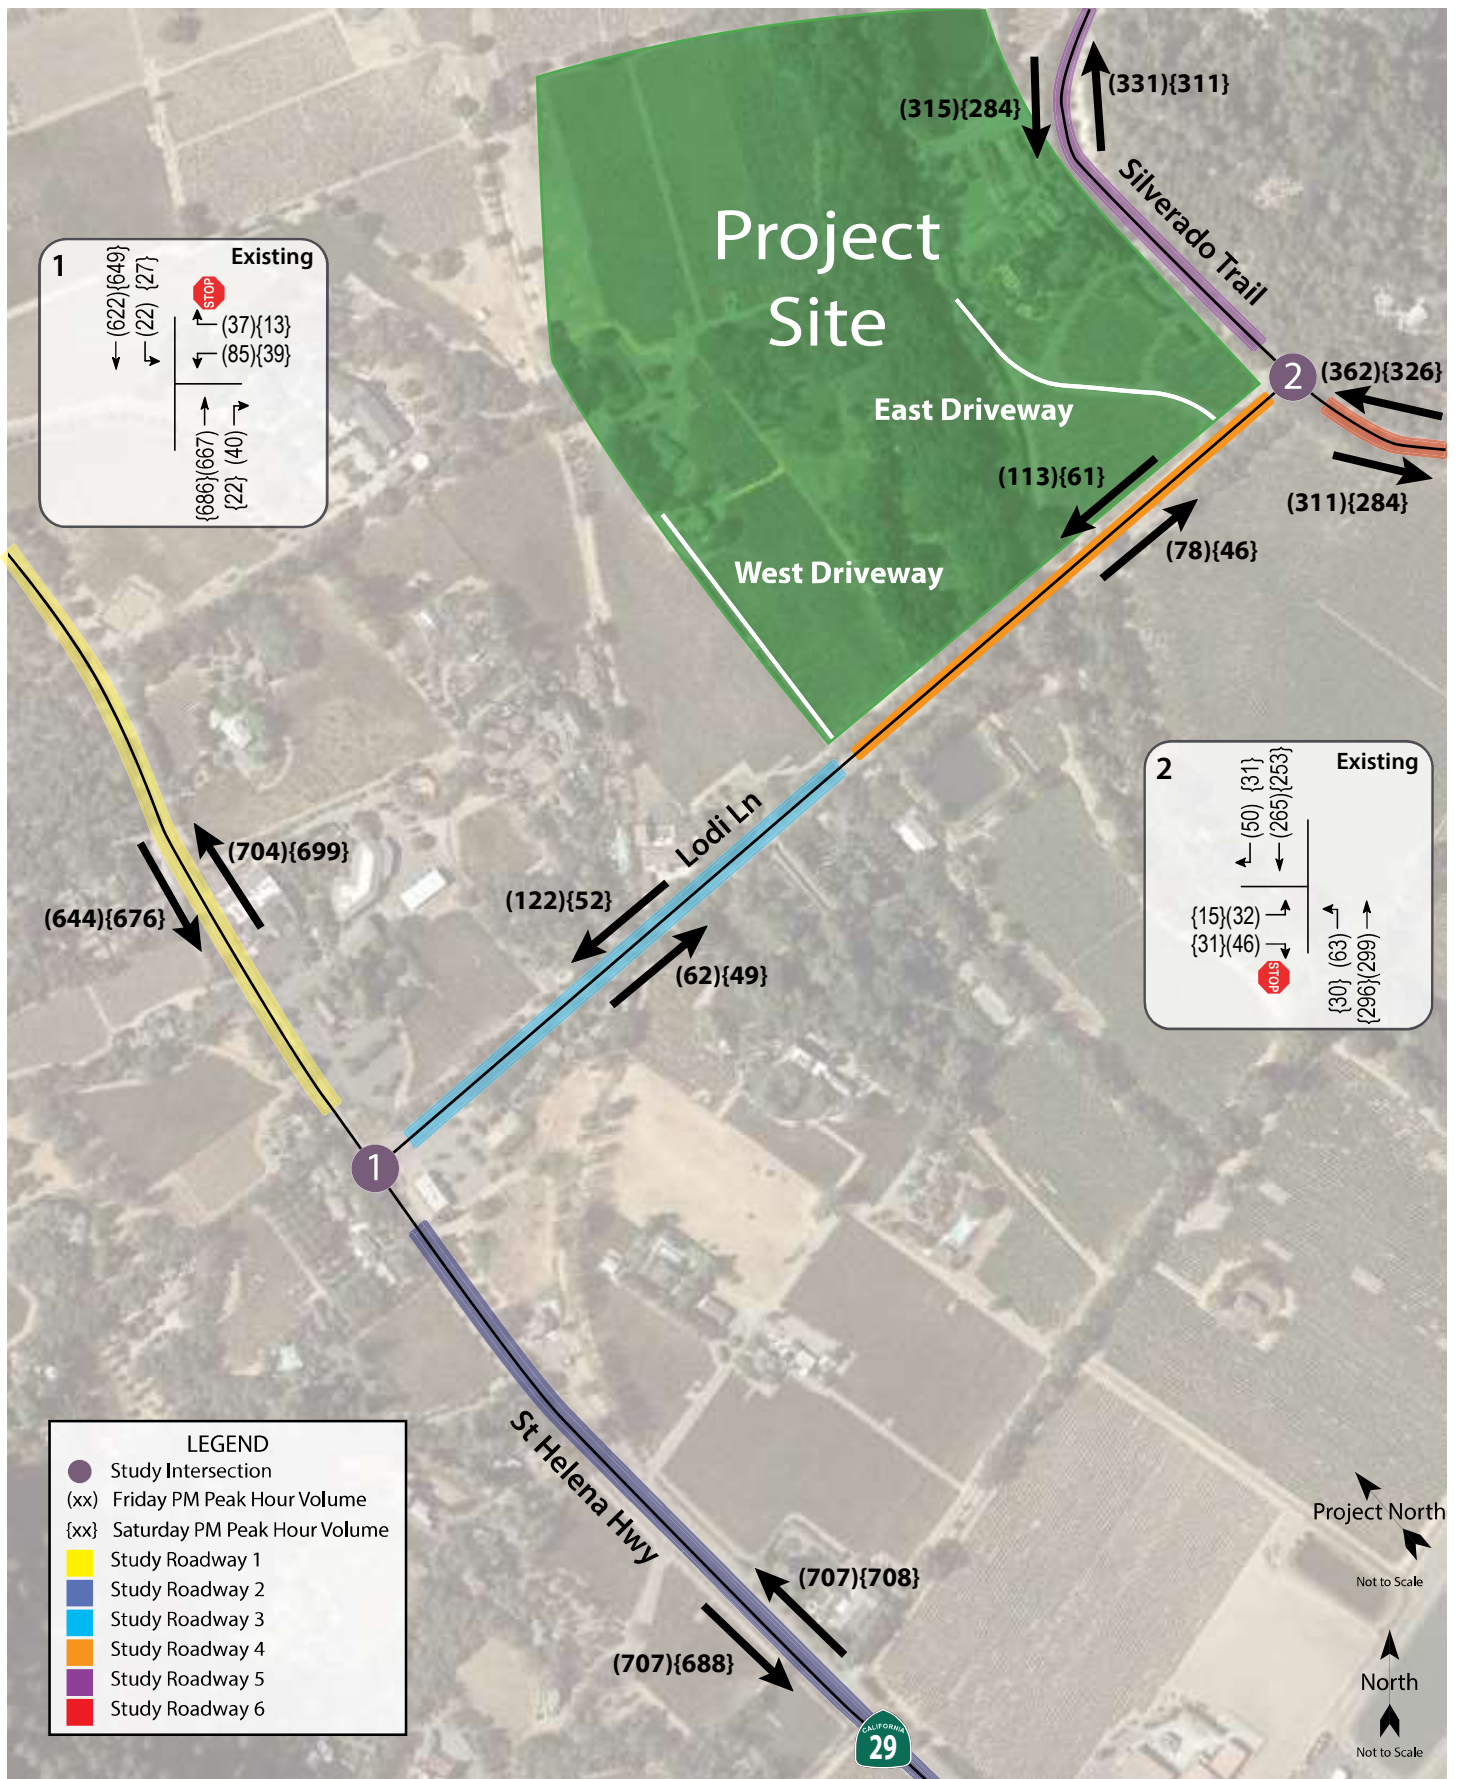

Study Intersection <i>Approach</i>	Friday PM Peak		Saturday MD Peak	
	Delay	LOS	Delay	LOS
1. SR 29/Lodi Ln	4.4	A	1.5	A
<i>Westbound (Lodi Ln) Approach</i>	<b>51.1</b>	<b>F</b>	<i>34.7</i>	<i>D</i>
2. Silverado Trail/Lodi Ln	2.0	A	1.2	A
<i>Eastbound (Lodi Ln) Approach</i>	<i>12.4</i>	<i>B</i>	<i>11.4</i>	<i>B</i>

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text denotes unacceptable operation

The County's General Plan does not specify an LOS standard for unsignalized intersections, which are to be evaluated on case-by-case basis, so for the purposes of this analysis and to be consistent with the recommendations in the County's TIS Guidelines, LOS D was considered the target threshold for stop-controlled approaches at unsignalized intersections. The TIS Guidelines also recommend that peak hour signal warrants be evaluated for unsignalized intersections that operate at LOS E or F; however, based on previous discussions with County and Caltrans staff, it is understood that installation of a traffic signal would not be appropriate at either of the study intersections so warrants were not evaluated.

## Roadway Segment Levels of Service

Under Existing Conditions, the study segments all operate at LOS C or better during both peak hours, which meets the County's standard of LOS D. The Existing segment volumes are shown in Figure 2 with the intersection volumes. A summary of the roadway segment level of service calculations is shown in Table 7, and copies of the roadway segment Level of Service calculations for all evaluated scenarios are provided in Appendix D.

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

## Near-Term Conditions

Trips associated with the pending Inn at the Abbey project to be located on the Freemark Abbey Winery property at the west end of Lodi Lane were added to Existing intersection and segment volumes in order to develop volumes that would be representative of conditions once the lodging project is open. The Inn at the Abbey project consists of 79 hotel rooms and is expected to generate an average of 645 new trips per day, including 33 weekday p.m. peak hour trips and 57 trips during the weekend peak hour, as documented in the *Traffic Impact Study for the Inn at the Abbey, W-Trans, 2019*. The “Project” volumes from this prior analysis were used to evaluate the Near-Term Conditions scenario, which is also known as Baseline or Existing plus Approved Conditions.

## Intersection Levels of Service

Under Near-Term Conditions, the stop-controlled approach at SR 29/Lodi Lane would continue to operate at LOS F during the Friday p.m. peak hour and would deteriorate from LOS D to LOS E during the Saturday p.m. peak hour. The intersection of Silverado Trail/Lodi Lane would operate acceptably during both peak

hours. The Near-Term intersection volumes are shown in Figure 3 and a summary of the intersection Level of Service calculations is contained in Table 8.

**Table 8 – Near-Term Peak Hour Intersection Levels of Service**

2. Silverado Trail/Lodi Ln <i>Eastbound (Lodi Ln) Approach</i>	2.0 <b>12.4</b>	A <b>B</b>	1.3 <b>11.4</b>	A <b>B</b>

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text denotes unacceptable operation

## Roadway Segment Levels of Service

Under Near-Term Conditions, all six study roadway segments are expected to operate at LOS C or better during both peak hours. Near-Term segment volumes are shown in Figure 3 and a summary of the roadway segment Level of Service calculations is shown in Table 9.

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

## Cumulative (Future) Conditions

Future volumes for the horizon year 2040 were calculated based on output from the *Napa Solano Travel Demand Model*, maintained by the Solano Transportation Authority (STA). Base year (2015) and future (2040) segment volumes for the weekday p.m. peak hour were used to calculate growth factors for SR 29 and Silverado Trail; it is noted that Lodi Lane is not included in the model so the growth on this roadway was assumed to increase at one-half percent annually given that there are limited opportunities for growth on the segment.

The growth factors projected by the model were adjusted to account for the four years of growth that had already occurred between the base year (2015) and existing (2019) count data, resulting in a growth factor of 1.46 for SR 29 and 1.37 for Silverado Trail. The existing counts were then multiplied by the adjusted growth factors to project likely Future Friday p.m. peak hour turning movement volumes at the study intersections. The same growth factors used for the Friday p.m. peak hour were used for the Saturday p.m. peak hour as the model does not contain information for weekend days. Roadway segment volumes for each segment were then derived from the projected Future intersection turning movement volumes.

## Intersection Levels of Service

Under Cumulative Conditions, and with no changes to the intersection's configuration or controls, the stop-controlled approach at SR 29/Lodi Lane would be expected to operate at LOS F during both peak hours with calculated delays well above what is considered reliable within the bounds of the HCM methodology. However, the intersection of Silverado Trail/Lodi Lane would operate acceptably during both peak hours. The Cumulative intersection volumes are shown in Figure 4 and a summary of the intersection level of service calculations is contained in Table 10.

**Table 10 – Cumulative Peak Hour Intersection Levels of Service**

## Project Description

The proposed project includes construction of a new wine production building on the recently acquired adjacent parcel (to be known as the “West Winery”), expansion of the existing Estate House, and development of additional outdoor hospitality areas. As part of the project, the current Use Permit would be updated to allow for an increase in daily visitation as well as production. No changes are proposed to staffing levels at this time. One of the main goals for the proposed modification is to allow for the efficient processing of grapes so that fruit that would otherwise be trucked to a Duckhorn Wine Company (DWC) facility in Hopland, CA (approximately 60 miles away) can be processed on-site. The following activities are proposed that would affect trip generation, and would be the same for both non-harvest and harvest seasons:

- An increase in production from 160,000 to 300,000 gallons annually;
- An increase in maximum daily visitation during both weekdays and weekend days from 82 to 219;
- A decrease in the largest marketing event from 600 to 400 guests.

Access to the Estate House and all hospitality areas would continue to occur via the existing driveway on Lodi Lane near Silverado Trail. The new West Winery would be accessed from an existing driveway on Lodi Lane approximate halfway between SR 29 and Silverado Trail; no visitation would occur at the West Winery as it would serve production activities only. The project site plan is shown in Figure 5.

## Trip Generation

The County of Napa's Winery Traffic Information/Trip Generation Sheet, updated in August 2019, was used to determine the anticipated trip generation for the existing and proposed conditions. The form estimates the number of daily trips for Fridays and Saturdays during typical operation and harvest season based on the number of full- and part-time employees, maximum daily visitors, and production.

The County's methodology assigns 38 percent of Friday trips to the p.m. peak hour and 57 percent of Saturday trips to the p.m. peak hour. However, recent updates to the County's policy have provided alternatives to using these standard temporal distributions, which is Option A per the policy. The County now allows the use of standard ITE rates (Option B) or site-specific peak-hour data (Option C) to estimate the number of peak hour trips expected to be generated by a proposed project as a percent of the daily trips estimated using the County's standard form. Because the winery is already in operation, it was determined that actual, site-specific data would provide the most accurate representation of the project's potential peak hour trips, so Option C was selected.

Based on actual site data collected during harvest in October 2019, approximately 14 and 15 percent of the total daily trips occur during the peak hour of the generator on Fridays and Saturdays, respectively, which generally occurred in the afternoon on both days. The percentages for the peak hour of the generator were used to estimate the number of trips generated during both the Friday and Saturday afternoon p.m. peak hours as a function of total daily trips calculated using the formulas on the County's form. The inbound versus outbound ratios for both peak hours were also reviewed based on the actual driveway counts, and it was determined that the site experiences a 54/46 percent split between inbound and outbound trips during the Friday p.m. peak hour and a 53/47 percent split during the Saturday p.m. peak hour. Copies of the Napa County Winery Traffic Information/Trip Generation Sheets are enclosed in Appendix E, along with supporting calculations for the applied peak hour percentages and inbound/outbound ratios.

Based on application of these assumptions, operation with the proposed modification would be expected to generate a maximum of 356 trips on a Friday during harvest, with 50 trips occurring during the peak hour and 344 trips on a Saturday with 52 trips during the peak hour. As shown in Table 12, this would result in a net increase of 120 trips per Friday, including 17 new trips during the p.m. peak hour, and a net increase of 112 new trips per Saturday also with 17 new trips during the peak hour.

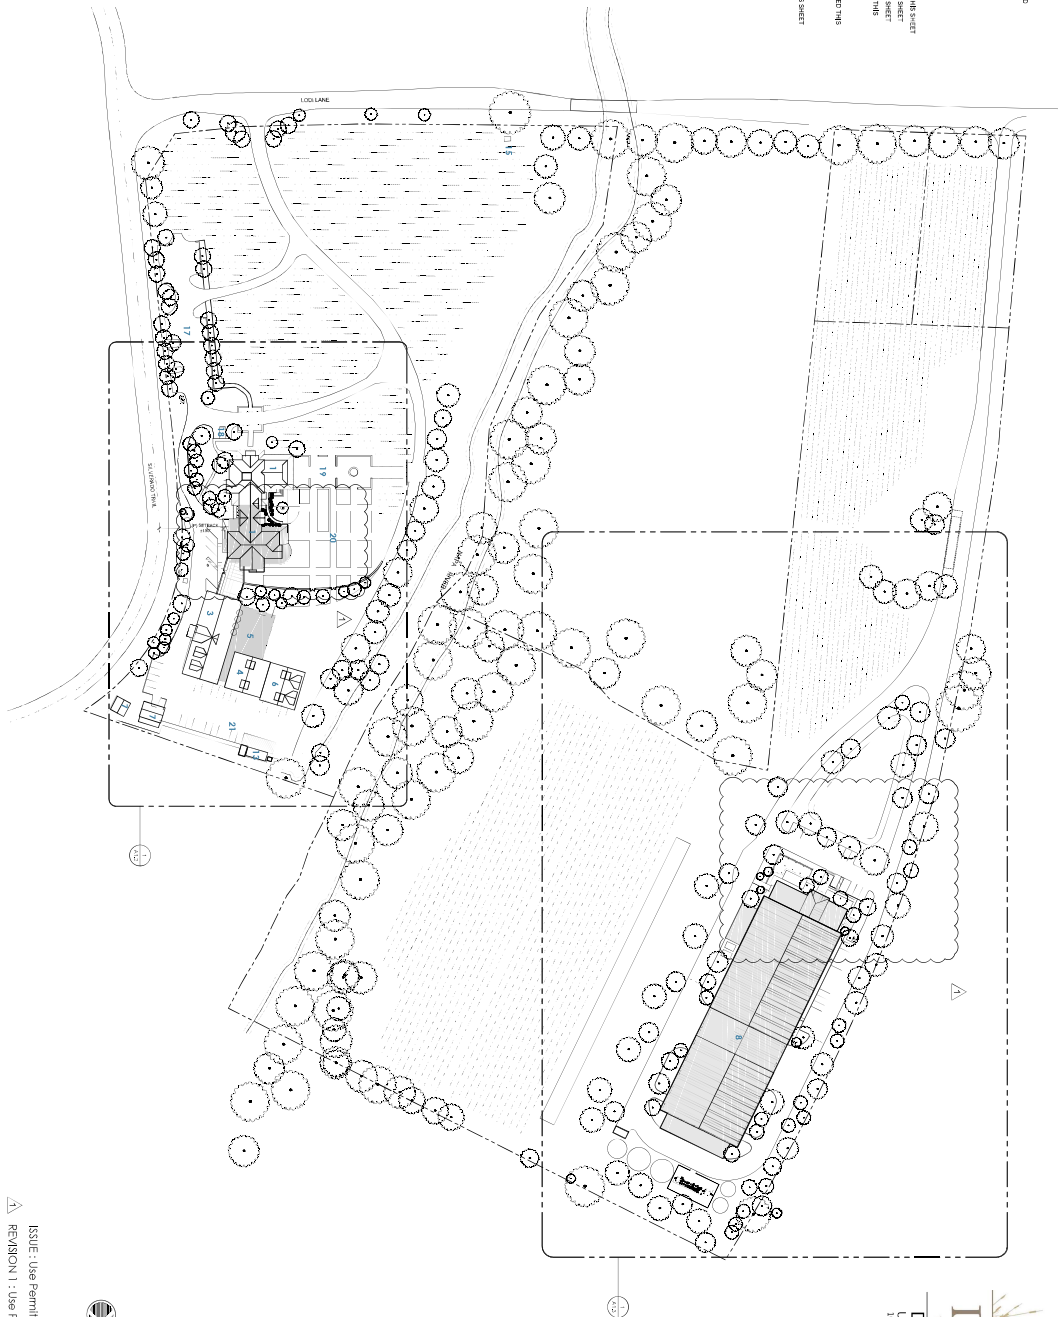

**Table 12 – Trip Generation Summary During Harvest**

Scenario	Daily		Friday PM Peak			Saturday PM Peak		
	Friday	Saturday	Trips	In	Out	Trips	In	Out

PHOTOGRAPHY: VRA ARCHITECTS

While the LOS analysis was based on the anticipated trip generation during harvest, it should be noted that during typical non-harvest conditions the project would be expected to result in 108 new daily trips on a Friday and 101 new daily trips on a Saturday.

## Trip Distribution

The pattern used to allocate the new project trips to the street network was determined by reviewing existing turning movements at the study intersections as well as anticipated travel patterns for tasting room visitors and current operations. As part of the proposed changes to the Use Permit, employees and visitors will be instructed via signage at the driveway exits to use SR 29 to travel north and Silverado Trail to travel south in an effort to avoid making time-consuming left-turn movements from Lodi Lane onto either SR 29 or Silverado Trail during peak hours, so this operational parameter was incorporated into the distribution assumptions. The applied distribution assumptions are shown in Table 13.

**Table 13 – Trip Distribution Assumptions**

Route	Inbound	Outbound
SR 29 (To/From the North)	25%	35%
SR 29 (From the South)	25%	0%
Silverado Trail (From the North)	10%	0%
Silverado Trail (To/From the South)	40%	65%
<b>TOTAL</b>	<b>100%</b>	<b>100%</b>

## Intersection Operation

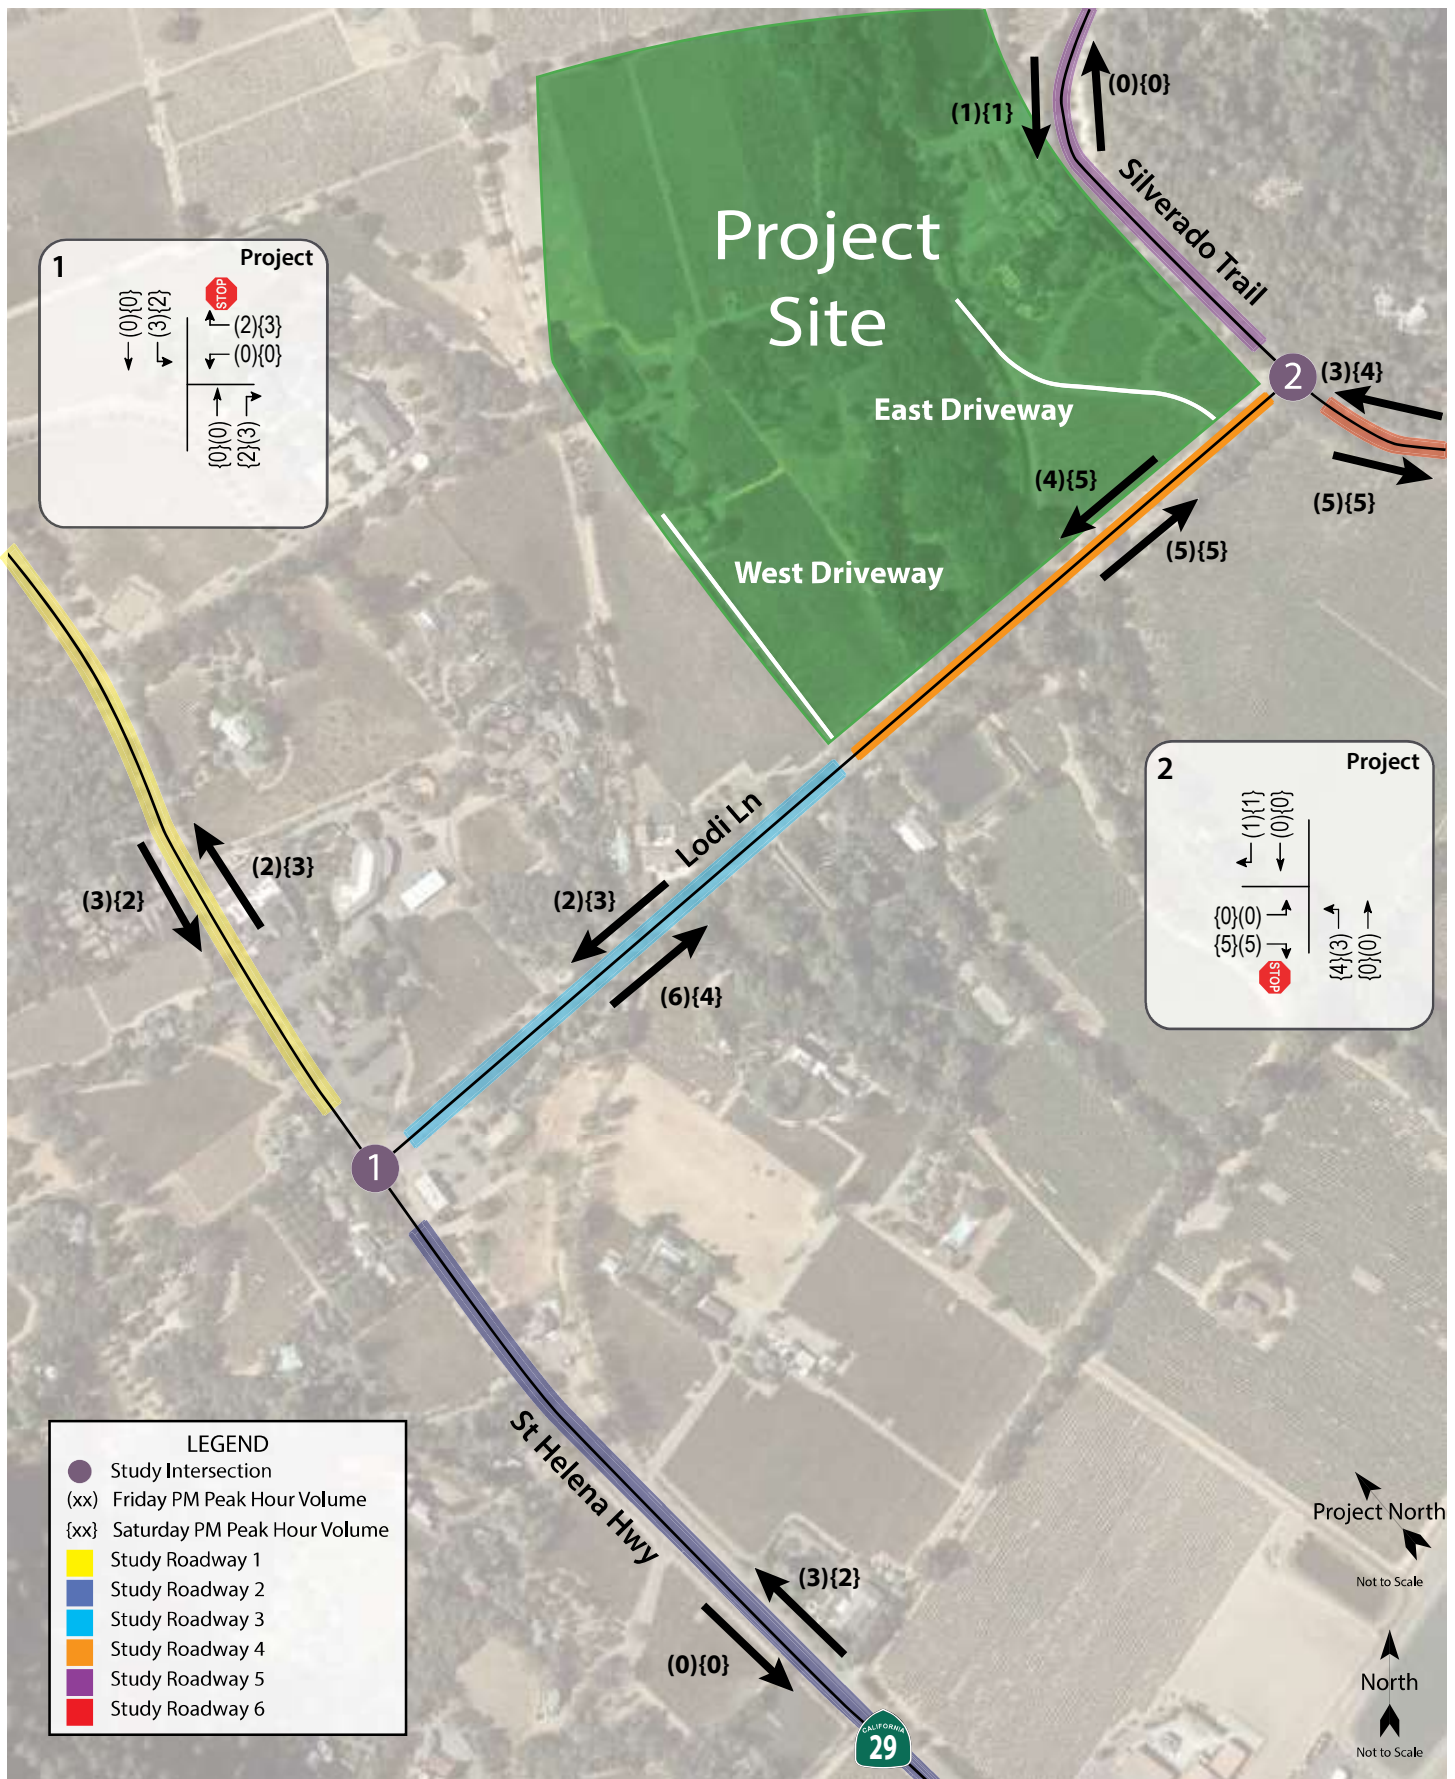

### Existing plus Project Conditions

Upon the addition of project trips to existing volumes, both study intersections are expected to continue operating at the same service levels as under Existing Conditions. Silverado Trail/Lodi Lane would continue to operate acceptably, and SR 29/Lodi Lane would continue to operate unacceptably as LOS F on the stop-controlled approach during the Friday p.m. peak hour. These results are summarized in Table 14 and intersection project traffic volumes are shown in Figure 6.

**Table 14 – Existing and Existing plus Project Peak Hour Intersection Levels of Service**

Study Intersection <i>Approach</i>	Existing Conditions				Existing plus Project			
	Friday PM		Saturday PM		Friday PM		Saturday PM	
	Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1. SR 29/Lodi Ln	4.4	A	1.5	A	4.6	A	1.5	A
<i>Westbound (Lodi Ln) Approach</i>	<b>51.1</b>	<b>F</b>	<b>34.7</b>	<b>D</b>	<b>52.1</b>	<b>F</b>	<b>33.9</b>	<b>D</b>
2. Silverado Trail/Lodi Ln	2.0	A	1.2	A	2.0	A	1.3	A
<i>Eastbound (Lodi Ln) Approach</i>	<b>12.4</b>	<b>B</b>	<b>11.4</b>	<b>B</b>	<b>12.3</b>	<b>B</b>	<b>11.3</b>	<b>B</b>

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text denotes unacceptable operation

**Traffic Impact Study for the Duckhorn Vineyards Use Permit Modification**  
**Figure 6 – Project Traffic Volumes**

It should be noted that with the addition of project traffic, calculated delays on the stop-controlled approaches decreases slightly during some scenarios compared to conditions without the project. While this is counter-intuitive, this condition occurs because, based on the applicant's proposal to use SR 29 and Silverado Trail as a one-way couplet for outbound trips, the project would add only right-turn movements to the stop-controlled approaches at each intersection, which movements have delays that are lower than the approach average, resulting in a slight reduction in the overall average delay for that approach. The conclusion could incorrectly be drawn that operation would improve with the addition of project trips based on this data alone; however, it is more appropriate to conclude that the project trips are expected to make use of excess capacity in the right-turn movements, so drivers will experience little, if any, change in conditions as a result of the project.

**Finding** – Although the stop-controlled approach at SR 29/Lodi Lane would continue to operate at LOS F during the Friday p.m. peak hour with the addition of project trips, the project's effect would be considered acceptable under County criterion since the increase in delay on the approach would be less than five seconds.

### Near-Term plus Project Conditions

Upon the addition of project trips to Near-Term volumes, both study intersections are expected to continue operating at the same service levels as without the project. Silverado Trail/Lodi Lane would continue to operate acceptably, and SR 29/Lodi Lane would continue to operate unacceptably as LOS F on the stop-controlled approach during the Friday p.m. peak hour and LOS E during the Saturday p.m. peak hour. These results are summarized in Table 15.

**Table 15 – Near-Term and Near-Term plus Project Peak Hour Intersection Levels of Service**

Study Intersection <i>Approach</i>	Near-Term Conditions				Near-Term plus Project			
	Friday PM		Saturday PM		Friday PM		Saturday PM	
	Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1. SR 29/Lodi Ln	5.1	A	1.8	A	5.3	A	1.9	A
<i>Westbound (Lodi Ln) Approach</i>	<b>56.6</b>	<b>F</b>	<b>36.5</b>	<b>E</b>	<b>57.9</b>	<b>F</b>	<b>35.9</b>	<b>E</b>
2. Silverado Trail/Lodi Ln	2.0	A	1.3	A	2.1	A	1.4	A
<i>Eastbound (Lodi Ln) Approach</i>	<b>12.4</b>	<b>B</b>	<b>11.4</b>	<b>B</b>	<b>12.4</b>	<b>B</b>	<b>11.4</b>	<b>B</b>

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text denotes unacceptable operation

**Finding** – Consistent with Existing plus Project Conditions, although the stop-controlled approach at SR 29/Lodi Lane would continue to operate at LOS E and F with the addition of project trips, the project's effect would be considered acceptable under County criterion since the increase in delay on the approach would be less than five seconds

### Cumulative (Future) plus Project Conditions

Upon the addition of project trips to the projected Cumulative volumes, both study intersections are expected to continue operating at the same service levels as without the project. Silverado Trail/Lodi Lane would continue to operate acceptably, and SR 29/Lodi Lane would continue to operate unacceptably

as LOS F on the stop-controlled approach during both peak hours. These results are summarized in Table 16.

**Table 16 – Cumulative and Cumulative plus Project Peak Hour Intersection Levels of Service**

Study Intersection <i>Approach</i>	Cumulative Conditions				Cumulative plus Project			
	Friday PM		Saturday PM		Friday PM		Saturday PM	
	Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1. SR 29/Lodi Ln	23.6	C	3.7	A	24.6	C	3.8	A
<i>Westbound (Lodi Ln) Approach</i>	<b>361.8</b>	<b>F</b>	<b>126.9</b>	<b>F</b>	<b>373.2</b>	<b>F</b>	<b>125.7</b>	<b>F</b>
<i>Restripe to Provide Right-Turn Lane</i>	-	-	-	-	<b>255.7</b>	<b>F</b>	<b>114.9</b>	<b>F</b>
2. Silverado Trail/Lodi Ln	1.9	A	1.0	A	1.9	A	1.1	A
<i>Eastbound (Lodi Ln) Approach</i>	<b>14.5</b>	<b>B</b>	<b>12.5</b>	<b>B</b>	<b>14.4</b>	<b>B</b>	<b>12.4</b>	<b>B</b>

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text denotes unacceptable operation; **Shaded cells** represent recommended improvements

Under the County's criterion, a project's effect is considered adverse in the Cumulative Conditions scenario if the project's volume is equal to, or greater than, ten percent of the difference between Future and Existing volumes on the impacted approach at two-way stop-controlled intersections calculated using the following equation:

- Project Contribution % = Project Trips ÷ (Cumulative Volumes – Existing Volumes)

Based on this criterion, the project's effect would be considered adverse during both peak hours even though the project would only result in two new trips during the Friday peak hour and three new trips during the Saturday peak hour, as shown below.

- Friday PM Project Contribution % =  $2 \div (135 - 122) = 15\%$
- Saturday PM Project Contribution % =  $3 \div (57 - 52) = 60\%$

The *Traffic Impact Study for the Inn at the Abbey* also identified an adverse effect at SR 29/Lodi Lane under Cumulative Conditions and recommended restriping the stop-controlled approach to include a separate right-turn lane. With this improvement, the stop-controlled delays would be reduced to less than the delays without the project, as shown in the table above. It is recommended that Duckhorn work with the applicant for the Inn at the Abbey to share the restriping improvements. Based on the number of trips that each project would be expected to add to the impacted approach during the critical Friday p.m. peak hour, a proportional share of the improvements would be 18 percent for Duckhorn and 82 percent for the Inn at the Abbey.

**Finding** – The project would result in an adverse effect at SR 29/Lodi Lane since the intersection would operate at LOS F on the minor street approach and project trips represent more than 10 percent of the anticipated growth during each peak hour.

**Recommendation** – It is recommended that the westbound approach at SR 29/Lodi Lane be restriped to include a dedicated right-turn lane. The cost for this improvement could be shared with the Inn at the Abbey since the improvement was also recommended for that project.

## Roadway Segment Operation

### Existing plus Project Conditions

Under Existing plus Project Conditions, the study roadway segments are expected to continue operating acceptably at the same levels of service as without project traffic in both directions during both peak hours. These results are summarized in Table 17 and project segment volumes are shown in Figure 6.

**Table 17 – Existing and Existing plus Project Peak Hour Roadway Segment Levels of Service**

Study Segment Direction	Existing Conditions				Existing plus Project			
	Friday PM		Saturday PM		Friday PM		Saturday PM	
	PTSF	LOS	PTSF	LOS	PTSF	LOS	PTSF	LOS
1. SR 29 - North of Lodi Ln								
Northbound	65.1	C	64.9	C	65.2	C	65.0	C
Southbound	63.0	C	64.4	C	63.3	C	64.4	C
2. SR 29 - South of Lodi Ln								
Northbound	65.3	C	65.3	C	65.4	C	65.4	C
Southbound	65.6	C	64.8	C	65.6	C	64.8	C
3. Lodi Ln - West of Project Dwy								
Eastbound	17.6	A	15.1	A	18.7	A	15.5	A
Westbound	27.0	A	15.7	A	27.2	A	16.3	A
4. Lodi Ln - East of Project Dwy								
Eastbound	20.4	A	14.5	A	21.3	A	15.6	A
Westbound	25.2	A	17.5	A	25.8	A	18.1	A
5. Silverado Trail - North of Lodi Ln								
Northbound	46.6	B	46.3	B	46.6	B	46.3	B
Southbound	45.1	B	43.9	B	45.2	B	44.0	B
6. Silverado Trail - South of Lodi Ln								
Northbound	48.8	B	47.5	B	49.0	B	47.8	B
Southbound	44.8	B	43.9	B	45.2	B	44.2	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

**Finding** – The study roadways are expected to continue operating acceptably upon the addition of project-generated traffic to Existing volumes and the project's effect would be considered acceptable.

## Near-Term plus Project Conditions

Under Near-Term plus Project Conditions, the study roadway segments are expected to continue operating acceptably at the same levels of service as without project traffic in both directions during both peak hours. These results are summarized in Table 18.

Table 18 – Near-Term and Near-Term plus Project Peak Hour Roadway Segment Levels of Service								
Study Segment Direction	Near-Term Conditions				Near-Term plus Project

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

**Finding** – The study roadway segments are expected to continue operating at LOS D or better upon the addition of project-generated traffic to Cumulative volumes, and the project’s effect would be considered acceptable.

# Vehicle Miles Traveled

---

## Background and Threshold of Significance

Senate Bill (SB) 743 established a change in the metric to be applied for determining transportation impacts associated with development projects. Rather than the delay-based criteria associated with a Level of Service (LOS) analysis, the increase in Vehicle Miles Traveled (VMT) as a result of a project is now the basis for determining California Environmental Quality Act (CEQA) impacts with respect to transportation and traffic. As of the date of this analysis, the County of Napa has not yet established thresholds of significance related to VMT. As a result, the project-related VMT impacts were assessed based on guidance provided by the California Governor's Office of Planning and Research (OPR) in the publication *Transportation Impacts (SB 743) CEQA Guidelines Update and Technical Advisory*, 2018.

## Project Impact

The OPR Technical Advisory identifies several criteria that may be used to identify certain types of projects that are unlikely to have a significant VMT impact and can be "screened" from further analysis. One of these screening criteria pertains to small projects, which OPR defines as generating fewer than 110 new vehicle trips per day on average. OPR specifies that VMT should be based on a typical weekday and should take into consideration seasonal fluctuations. The proposed project is anticipated to result in 120 new daily vehicle trips on harvest Friday and 108 new daily vehicle trips on a non-harvest Friday, though based on count data collected at the existing driveway the winery generates approximately 36 percent fewer trips on the other weekdays compared to Friday. Adjusting the number of net new trips anticipated on Friday to a typical weekday average, and accounting for a two-month harvest season, the project would be expected to result in approximately 79 new daily trips per weekday over the course of the year. Since this is below the small project threshold of 110 trips, it is reasonable to conclude that the project can be presumed to have a less-than-significant transportation impact on VMT.

It should also be noted that one of the main goals of the proposed production expansion is to allow for more Napa Valley fruit to be processed on-site that would otherwise be trucked to a Duckhorn Wine Company (DWC) facility in Hopland approximately 60 miles away. So, while the project would increase the number of truck trips in the immediate vicinity, the project has the potential to decrease Duckhorn's total VMT associated with grape hauling in Napa, Sonoma, and Mendocino counties.

**Finding** – Based on OPR guidance, the project would be expected to have a less-than-significant transportation impact on VMT.

# Alternative Modes

---

## Pedestrian Facilities

Consistent with expectations for a rural area, there are no existing pedestrian facilities in the project vicinity and pedestrian trips to and from the site are not expected so this condition is acceptable.

**Finding** – The lack of pedestrian facilities serving the project site is acceptable.

## Bicycle Facilities

While rural wineries are not typically a high generator of bicycle trips, the existing Class II bike lanes on Silverado Trail along with the shared use of Lodi Lane with motorists and planned facilities consisting of the Vine Trail and a Class III bike route on SR 29 would provide adequate access for bicyclists.

**Finding** – Access for bicyclists would be adequate considering the limited demand.

## Bicycle Storage

The County does not have specific bicycle parking requirements for wineries; however, the project should provide bicycle parking consistent with the requirements outlined in Chapter 18.110.040 of the Napa County Code of Ordinances which states that ten bicycle parking spaces should be provided for all nonresidential uses where ten or more automobile parking spaces are required. With a proposed supply of 76 permanent vehicle parking spaces, the project would need to provide ten bicycle spaces on-site.

**Recommendation** – The applicant should ensure parking for a minimum of ten bicycles is provided somewhere on-site, preferably near the tasting room.

## Transit

The nearest transit stops approximately 0.7 miles from the project site on SR 29 are adequate for the limited anticipated demand. While 0.7 miles is not considered a comfortable walking distance for most, this distance is well within the range of comfort for a bicyclist so transit could be used and accompanied with a bicycle, if needed.

**Finding** – The lack of convenient transit access does not result in an impact given the limited potential demand.

# Access and Circulation

---

## Site Access

Access to the Estate House and all hospitality areas would continue to occur via the existing east driveway on Lodi Lane approximately 200 feet west of Silverado Trail. The new West Winery would be accessed from an existing driveway on Lodi Lane approximate halfway between SR 29 and Silverado Trail and would be used for winery production activities only; no visitation would occur at the West Winery.

## Sight Distance

Sight distances along Lodi Lane at the existing driveways were evaluated based on sight distance criteria contained in the *Highway Design Manual* published by Caltrans. The recommended sight distances for minor street approaches that are driveways are based on stopping sight distance, with approach travel speeds used as the basis for determining the recommended sight distance.

For the posted 40-mph speed limit on Lodi Lane, the recommended stopping sight distance is 300 feet. Based on a review of field conditions, sight distance at each driveway extends more than 300 feet in both directions, which is adequate for the posted speed limit. Adequate sight distance is also available for following drivers to see and react to a vehicle stopped to make a turn into either driveway, though given the low traffic volume on Lodi Lane it is unlikely that there would be a vehicle stopped in the travel lane while waiting to turn into the driveway.

**Finding** – Sight distances on Lodi Lane are adequate to meet the applied criteria for both entering and exiting turning movements.

## Turn Lane Warrants

The need for a left-turn lane on Lodi Lane at the project driveways was evaluated using the County of Napa's published guidance considering the average daily traffic (ADT) volume projected to use the driveway as a function of roadway ADT. A left-turn lane meets warrants when the corresponding value plots above the curve indicated on the Left Turn Lane Warrant Graph from the *Napa County Road and Street Standards* and is unwarranted if the value plots below the curve.

Count data collected during harvest in October 2019 indicates that the east driveway has an ADT of 300 vehicles and Lodi Lane has an ADT of 1,357 vehicles. Based on these volumes, a left-turn lane would be warranted under Existing Conditions without even considering project trips according to the County's methodology. Of the 79 new daily trips generated on a typical weekday, approximately two-thirds are expected to occur via the east driveway and one-third at the west driveway. Upon the addition of project trips, a left-turn lane would continue to be warranted at the east driveway, though a left-turn lane would not be warranted at the west driveway. Copies of the left-turn lane warrant graphs are provided in Appendix F.

Since a left-turn lane would be warranted at the east driveway, the design requirements and feasibility of constructing a turn lane were explored. The Napa County left-turn lane design standard defaults to the Caltrans *Highway Design Manual* (HDM) for speeds other than 55 miles per hour (mph). Section 405.2

“Left-turn Channelization” of the HDM sets the design requirements for left-turn lanes, including the required length of the bay taper and deceleration lane so that turning vehicles have sufficient space to decelerate as they approach the turn without impacting through traffic. There are two separate sets of design criteria specified in the HDM, one for rural high speed, high volume facilities and another for urban facilities with constraints and low traffic volumes and speeds. Although Lodi Lane is not in an urban setting, there are constraints such as the bridge over the Napa River approximately 410 feet west of the driveway and the intersection with Silverado Trail approximately 200 feet to the east. Further, the volumes and speeds observed on Lodi Lane indicate that the less-restrictive criteria for constrained settings are more appropriate.

For a design speed of 40 mph, a total of 578 feet of roadway widening (365 feet for deceleration and storage and 213 feet for transition) would be needed to accommodate a left-turn lane if all of the widening were to occur on one side of the roadway. If the widening were to be split evenly on both sides of the facility, then 472 feet would be required, including 365 feet for deceleration and storage and 107 feet for transition. Neither of these options could be accomplished within the space available between the Napa River bridge and the driveway; however the HDM states that partial deceleration is permitted in the through lane and the design speed for the facility may be reduced by up to 20 mph for design of the deceleration lane. Using a design speed of 20 mph, a total of 418 feet of widening (205 for deceleration and storage and 213 for transition) would be needed for the one-side condition and 312 feet (205 feet for deceleration and storage and 107 feet for transition) would be needed to widen on both sides.

While the latter design alternative could be accommodated geometrically within the space available between the Napa River bridge and the east driveway, the improvement would require removal of at least three trees on the north side of Lodi Lane for widening to one side and numerous heritage oak trees on the south side of the roadway if widening to both sides were to occur. Design exceptions are allowed per the *Napa County Road and Street Standards* if one of the following findings can be made:

- i. *The exception will preserve unique features of the natural environment which includes, but is not limited to, natural water courses, steep slopes, geological features, heritage oak trees, or other trees of least six inches in diameter at breast height and found by the decision-maker to be of significant importance, but does not include human altered environmental features such as vineyards and ornamental or decorative landscaping, or artificial features such as, rock walls, fences or the like;*
- ii. *The exception is necessary to accommodate physical site limitations such as grade differentials; and/or*
- iii. *The exception is necessary to accommodate other limiting factors such as recorded historical sites or legal constraints.*

Based on the number of trees greater than six inches in diameter that would need to be removed to accommodate construction of a left-turn lane at the east driveway, including numerous heritage oak trees, an exception to the requirements for a left-turn lane may be appropriate.

**Finding** – Upon the addition of project trips to Existing volumes, a left-turn lane would continue to be warranted at the east driveway but would not be warranted at the west driveway.

**Recommendation** – Although the left-turn lane warrant is met based on volumes alone, a review of the roadside conditions indicates that numerous trees would need to be removed to accommodate the turn lane; therefore, conditions to request an exception are satisfied.

## **Truck Access**

The AutoTURN application of AutoCAD was used to simulate the travel path for a standard 53-foot semi-truck and trailer, which is the largest vehicle that would be anticipated to access the site via the western driveway. Turning movements into and out of the western driveway were overlayed on the project site plan and it was determined that the driveway would be inadequate to accommodate trucks of this size. It is recommended that the driveway to the new West Winery be improved per Standard Detail P-2 of the *Napa County Road and Street Standards*, which calls for a minimum return radius and driveway width of 20 feet. Four access exhibits simulating inbound and outbound access to and from both directions are provided in Appendix G.

**Finding** – Based on the site plan, access for a 53-foot semi-trailer is not adequate at the western driveway in its existing condition.

**Recommendation** – The western driveway should be designed and improved per the requirements outlined in the *Napa County Road and Street Standards* for a rural commercial driveway.

# Parking

---

The project was analyzed to determine whether the proposed parking supply would be sufficient for the anticipated daily demand during harvest conditions. The project site, as proposed, would have a total of 76 parking spaces between both parcels.

To accommodate the daily parking demand for the winery and tasting room, there should be at least one space provided for every employee, as well as parking stalls for about 25 percent of the expected daily tasting room visitors. During harvest, there would be up to 56 full- and part-time employees and a maximum of 219 daily visitors to the tasting room. Assuming the County's standard occupancy rate of 2.8 guests per vehicle, a total of 78 guest vehicles would visit the site over the course of the day. Therefore, the proposed project would need at least 76 parking spaces, consisting of 56 for employees and 20 for guests assuming one-quarter of the guests would be there at any one time. The proposed supply of 76 spaces would be adequate to accommodate the approximate day-to-day peak demand.

**Finding** – The proposed permanent parking supply is adequate for the anticipated peak demand during typical harvest operations.

# Conclusions and Recommendations

---

## Conclusions

- The proposed modification to the Use Permit would be expected to result in a net increase of 120 daily trips on a Friday during harvest, including 17 new trips during the p.m. peak hour, and a net increase of 112 new trips on a Saturday during harvest, with 17 new trips during the peak hour.
- The study roadway segments of SR 29, Lodi Lane, and Silverado Trail are projected to operate acceptably at LOS D or better under Existing, Near-Term, and Cumulative Conditions, and would continue to do so with the addition of project traffic.
- The intersection of Silverado Trail/Lodi Lane is projected to operate acceptably at LOS B or better under Existing, Near-Term, and Cumulative Conditions, and would continue to do so with the addition of project traffic.
- Upon the addition of project trips to Existing and Near-Term volumes, the stop-controlled approach at SR 29/Lodi Lane would continue to operate unacceptably at LOS E or F, though the project would result in less than five seconds of additional delay so the effect is considered acceptable.
- Upon the addition of project trips to the anticipated Cumulative volumes, the stop-controlled approach at SR 29/Lodi Lane would continue to operate at LOS F with substantial delays and the project would result in an adverse effect since project trips represent more than 10 percent of the anticipated growth during each peak hour.
- Based on OPR guidance, the project would be expected to have a less-than-significant transportation impact on VMT.
- The lack of pedestrian facilities serving the project site does not result in an impact given the rural location and type of project.
- Similarly, the lack of convenient transit service does not result in an impact due to the lack of demand for such services, though employees could use a bicycle to travel between the project site and transit stops on SR 29 north of Lodi Lane.
- The existing Class II bike lanes on Silverado Trail along with the shared use of Lodi Lane with motorists and planned facilities consisting of the Vine Trail and a Class III bike route on SR 29 would provide adequate access for bicyclists, though such demand is expected to be limited.
- Sight distances on Lodi Lane are adequate at each driveway to meet the applied HDM criteria for both entering and exiting turning movements.
- Upon the addition of project trips to existing volumes, a left-turn lane would continue to be warranted at the east driveway based on application of the County's criterion but would not be warranted at the west driveway.

- As currently constructed, the western driveway is not adequate to accommodate turning movements for a 53-foot semi-truck and trailer.
- The proposed parking supply is adequate to accommodate the anticipated peak parking demand during harvest conditions.
- The intersection of Silverado Trail/Lodi Lane as well as the segments of Silverado Trail both north and south of the intersection have calculated collision rates above the statewide average for similar facilities.

## Recommendations

- It is recommended that whichever project is approved first between the Inn at the Abbey or Duckhorn Vineyards work with the County to install a northbound speed feedback sign on Silverado Trail near the Melka Estates Winery driveway. Additionally, the applicant should work with the County to install a speed feedback sign in the southbound direction near Glass Mountain Road.
- It is recommended that the westbound approach at SR 29/Lodi Lane be restriped to include a dedicated right-turn lane. The cost for this improvement could be shared with the Inn at the Abbey since it was also recommended for that project.
- Secure parking facilities for at least ten bicycles should be provided on-site.
- Although a left-turn lane is warranted at the east driveway and would continue to be warranted with the addition of project-generated traffic, a review of the roadside conditions indicates that numerous trees would need to be removed to accommodate the turn lane; therefore, conditions to request an exception are satisfied.
- The driveway to the west winery should be improved per the County's Road and Street Standards to accommodate large semi-trucks.

**Segment Length:** 0.5 miles

**Direction:** North/South

Collision Rate =  $\frac{\text{Number of Collisions} \times 1 \text{ Million}}{\text{ADT} \times \text{Days per Year} \times \text{Segment Length} \times \text{Number of Years}}$

Collision Rate =  $\frac{10}{6,500} \times \frac{1,000,000}{365 \times 0.5 \times 5}$

	Collision Rate	Fatality Rate	Injury Rate
<b>Study Segment</b>	<b>1.69 c/mvm</b>	<b>0.0%</b>	<b>10.0%</b>
<b>Statewide Average*</b>	<b>1.12 c/mvm</b>	<b>2.5%</b>	<b>46.6%</b>

#### **Notes**

ADT = average daily traffic volume

c/mvm = collisions per million vehicle miles

\* 2016 Collision Data on California State Highways, Caltrans

**Location:** Silverado Trail - Lodi Ln to Deer Park Rd

**Date of Count:** Friday, November 20, 2020

**Average Daily Traffic (ADT):** 6,700

**Number of Collisions:** 10

**Number of Injuries:** 1

**Number of Fatalities:** 0

**Start Date:** October 1, 2014

**End Date:** September 30, 2019

**Number of Years:** 5

**Highway Type:** Conventional 2 lanes or less

**Area:** Rural

**Design Speed:** ≤55

**Terrain:** Rolling/Mountain

**Segment Length:** 0.5 miles

**Direction:** North/South

Collision Rate =  $\frac{\text{Number of Collisions} \times 1 \text{ Million}}{\text{ADT} \times \text{Days per Year} \times \text{Segment Length} \times \text{Number of Years}}$

Collision Rate =  $\frac{10}{6,700} \times \frac{1,000,000}{365 \times 0.5 \times 5}$

	Collision Rate	Fatality Rate	Injury Rate
<b>Study Segment</b>	<b>1.64 c/mvm</b>	<b>0.0%</b>	<b>10.0%</b>
<b>Statewide Average*</b>	<b>1.12 c/mvm</b>	<b>2.5%</b>	<b>46.6%</b>

#### **Notes**

ADT = average daily traffic volume

c/mvm = collisions per million vehicle miles

\* 2016 Collision Data on California State Highways, Caltrans

## Napa County Winery Traffic Information/Trip Generation Forms and Site-Specific Peak Hour Calculations

**This page intentionally left blank**

## Existing Conditions Winery Traffic Information / Trip Generation

**Determine Winery Daily Trips.** Complete Sections A through I below to determine your winery project's estimated baseline daily and peak hour trips.

**Project Name:** Duckhorn Vineyards

**Project Scenario:**

**Existing**

### **Section A. Maximum Daily Weekday Traffic (Friday, non-harvest season)**

1.	Total number of FT employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
2.	Total number of PT employees:	<u>5</u>	x 1.90 one-way trips per employee	=	<u>9.5</u>	daily trips
3.	Maximum weekday visitors:	<u>82</u>	/2.6 visitors per vehicle x 2 one-way trips	=	<u>63.1</u>	daily trips
4.	Gallons of production:	<u>160000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>2.9</u>	daily trips
5.						
			TOTAL	=	<u>213</u>	daily trips

### **Section B. Maximum Daily Weekday Traffic (Friday, harvest season)**

6.	Total number of FT employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
7.	Total number of PT employees:	<u>11</u>	x 1.90 one-way trips per employee	=	<u>20.9</u>	daily trips
8.	Maximum weekday visitors:	<u>82</u>	/2.6 visitors per vehicle x 2 one-way trips	=	<u>63.1</u>	daily trips
9.	Gallons of production:	<u>160000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>2.9</u>	daily trips
10.	Avg. annual tons of grape on-haul:	<u>880</u>	/ 144 truck trips x 2 one-way trips	=	<u>12.2</u>	daily trips
11.						
			TOTAL	=	<u>236</u>	daily trips

### **Section C. Maximum Daily Weekend Traffic (Saturday, non-harvest season)**

12.	Total number of FT Sat. employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
13.	Total number of PT Sat. employees:	<u>5</u>	x 1.90 one-way trips per employee	=	<u>9.5</u>	daily trips
14.	Maximum Saturday visitors:	<u>82</u>	/2.8 visitors per vehicle x 2 one-way trips	=	<u>58.6</u>	daily trips
15.	Gallons of Production:	<u>160000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>2.9</u>	daily trips
16.						
			TOTAL	=	<u>208</u>	daily trips

### **Section D. Maximum Daily Weekend Traffic (Saturday, harvest season)**

17.	Total number of FT Sat. employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
18.	Total number of PT Sat. employees:	<u>11</u>	x 1.90 one-way trips per employee	=	<u>20.9</u>	daily trips
19.	Maximum Saturday visitors:	<u>82</u>	/2.8 visitors per vehicle x 2 one-way trips	=	<u>58.6</u>	daily trips
20.	Gallons of production:	<u>160000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>2.9</u>	daily trips
21.	Avg. annual tons of grape on-haul:	<u>880</u>	/ 144 truck trips x 2 one-way trips	=	<u>12.2</u>	daily trips
22.						
			TOTAL	=	<u>232</u>	daily trips

### **Section E. PM Peak Hour Trip Generation (Friday, non-harvest season)**

(Sum of daily trips from Sec. A, lines 3 and 4) x 0.38 + (No. of FTE) + (line 2 / 2)	=	<u>73</u>	PM peak trips
--	---	-----------	---------------

### **Section F. PM Peak Hour Trip Generation (Friday, harvest season)**

(Sum of daily trips, Sec. B, lines 8, 9, 10) x 0.38 + (No. of FTE) + (line 7 / 2)	=	<u>80</u>	PM peak trips
---	---	-----------	---------------

### **Section G. PM Peak Hour Trip Generation (Saturday, non-harvest season)**

(Daily trips from Sec. C, line 14 and 15) x 0.57 + (No. of FTE) + (line 13 / 2)	=	<u>83</u>	PM peak trips
---	---	-----------	---------------

### **Section H. PM Peak Hour Trip Generation (Saturday, harvest season)**

(Sum of daily trips Sec. D, lines 19, 20, 21) x 0.57 + (No. of FTE) + (line 18 / 2)	=	<u>93</u>	PM peak trips
---	---	-----------	---------------

### **Section I. Maximum Annual Trips**

(Sec. A, line 5 x 206) + (Sec. B, line 11 x 55) + (Sec. C, line 16 x 82) + (Sec. D, line 22 x 22)	=	<u>79018</u>	Annual trips
---	---	--------------	--------------

## Proposed Project Winery Traffic Information / Trip Generation

**Determine Winery Daily Trips.** Complete Sections J through R below to determine your winery project's estimated future and peak hour trips.

**Project Name:** Duckhorn Vineyards

**Project Scenario:**

**Proposed**

### **Section J. Maximum Daily Weekday Traffic (Friday, non-harvest season)**

1.	Total number of FT employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
2.	Total number of PT employees:	<u>5</u>	x 1.90 one-way trips per employee	=	<u>9.5</u>	daily trips
3.	Maximum weekday visitors:	<u>219</u>	/2.6 visitors per vehicle x 2 one-way trips	=	<u>168.5</u>	daily trips
4.	Gallons of production:	<u>300000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>5.4</u>	daily trips
5.						
			<b>TOTAL</b>	=	<u>321</u>	daily trips

### **Section K. Maximum Daily Weekday Traffic (Friday, harvest season)**

6.	Total number of FT employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
7.	Total number of PT employees:	<u>11</u>	x 1.90 one-way trips per employee	=	<u>20.9</u>	daily trips
8.	Maximum weekday visitors:	<u>219</u>	/2.6 visitors per vehicle x 2 one-way trips	=	<u>168.5</u>	daily trips
9.	Gallons of production:	<u>300000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>5.4</u>	daily trips
10.	Avg. annual tons of grape on-haul:	<u>1700</u>	/ 144 truck trips x 2 one-way trips	=	<u>23.6</u>	daily trips
11.						
			<b>TOTAL</b>	=	<u>356</u>	daily trips

### **Section L. Maximum Daily Weekend Traffic (Saturday, non-harvest season)**

12.	Total number of FT Sat. employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
13.	Total number of PT Sat. employees:	<u>5</u>	x 1.90 one-way trips per employee	=	<u>9.5</u>	daily trips
14.	Maximum Saturday visitors:	<u>219</u>	/2.8 visitors per vehicle x 2 one-way trips	=	<u>156.4</u>	daily trips
15.	Gallons of Production:	<u>300000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>5.4</u>	daily trips
16.						
			<b>TOTAL</b>	=	<u>309</u>	daily trips

### **Section M. Maximum Daily Weekend Traffic (Saturday, harvest season)**

17.	Total number of FT Sat. employees:	<u>45</u>	x 3.05 one-way trips per employee	=	<u>137.3</u>	daily trips
18.	Total number of PT Sat. employees:	<u>11</u>	x 1.90 one-way trips per employee	=	<u>20.9</u>	daily trips
19.	Maximum Saturday visitors:	<u>219</u>	/2.8 visitors per vehicle x 2 one-way trips	=	<u>156.4</u>	daily trips
20.	Gallons of production:	<u>300000</u>	/1,000 x 0.009 daily truck trips x 2 one-way trips	=	<u>5.4</u>	daily trips
21.	Avg. annual tons of grape on-haul:	<u>1700</u>	/ 144 truck trips x 2 one-way trips	=	<u>23.6</u>	daily trips
22.						
			<b>TOTAL</b>	=	<u>344</u>	daily trips

### **Section N. PM Peak Hour Trip Generation (Friday, non-harvest season)**

(Sum of daily trips from Sec. J, lines 3 and 4) x 0.38 + (No. of FTE) + (line 2 / 2)	=	<u>114</u>	PM peak trips
--	---	------------	---------------

### **Section O. PM Peak Hour Trip Generation (Friday, harvest season)**

(Sum of daily trips, Sec. K, lines 8, 9, 10) x 0.38 + (No. of FTE) + (line 7 / 2)	=	<u>126</u>	PM peak trips
---	---	------------	---------------

### **Section P. PM Peak Hour Trip Generation (Saturday, non-harvest season)**

(Daily trips from Sec. L, line 14 and 15) x 0.57 + (No. of FTE) + (line 13 / 2)	=	<u>140</u>	PM peak trips
---	---	------------	---------------

### **Section Q. PM Peak Hour Trip Generation (Saturday, harvest season)**

(Sum of daily trips Sec. M, lines 19, 20, 21) x 0.57 + (No. of FTE) + (line 18 / 2)	=	<u>156</u>	PM peak trips
---	---	------------	---------------

### **Section R. Maximum Annual Trips**

(Sec. J, line 5 x 206) + (Sec. K, line 11 x 55) + (Sec. L, line 16 x 82) + (Sec. M, line 22 x 22)	=	<u>118612</u>	Annual trips
---	---	---------------	--------------

## SITE SPECIFIC PEAK HOUR PERCENTAGE TRIP GENERATION CALCULATIONS

### Duckhorn Vineyards

#### Friday - Peak Hour of Generator

Day	Date	PM	PM Peak Hour Vol		Daily Vol	Peak Hour % of Daily
		Peak Hour	In	Out		
1 Friday	10/18/2020	2:00-3:00	29	29	423	14%
8 Friday	10/25/2019	2:00-3:00	31	23	379	14%
<b>AVERAGE</b>		<b>2:00-3:00</b>	<b>30</b>	<b>26</b>	<b>401</b>	<b>14%</b>
<b>Inbound/Outbound Distribution</b>			<b>54%</b>	<b>46%</b>		

#### Saturday - Peak Hour of Generator

Day	Date	MD	MD Peak Hour Vol		Daily Vol	Peak Hour % of Daily
		Peak Hour	In	Out		
2 Saturday	10/19/2019	12:00-1:00	35	28	392	16%
9 Saturday	10/26/2019	12:00-1:00	24	24	363	13%
<b>AVERAGE</b>		<b>12:30-1:30</b>	<b>30</b>	<b>26</b>	<b>378</b>	<b>15%</b>
